FCC Warning

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limitations are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult your local distributors or an experienced radio/TV technician for help.

Changes or modifications to the equipment, which are not approved by the party responsible for compliance, could affect the user's authority to operate the equipment.

Shielded interface cables must be used in order to comply with emission limits.

Revision History

| Manual Version | Firmware Version | Modification | Date |
|----------------|------------------|--|----------|
| 0.90 | 0.99.04 | The initial version | 20161007 |
| 0.90 | 0.99.0C | Add Rapid Spanning Tree(Section 3.4.5), Trap Destination(Section 3.3.6), Trap Configuration(Section 3.3.7), IGMP(Section 3.4.7), Ring Detection(Section 3.4.8) | 20170109 |
| 0.90 | 0.99.0F | Add Time Range (Section 3.3.5), SNMPv3 USM User (Section 3.3.7), Broadcast Storm Control (Section 3.4.2), LACP Port Configuration (Section 3.4.6.3), Mirroring Configuration (Section 3.4.9), Loop Detection (Section 3.4.12), DHCP Snooping (Section 3.4.15) Revise MAC Quotient (Section 3.4.6.1) | 20170217 |
| 0.90 | 0.99.0K | | 20170712 |

1. OVERVIEW

Thank you for choosing the Managed Industrial Gigabit Ethernet Switches. The Managed Industrial Gigabit Ethernet Switches are designed to meet the massive needs for Gigabit Ethernet network deployments and aim at Industrial applications that demand wide range of operating temperature. They are fully compliant with IEEE802.3, 802.3u, 802.3ab, 802.3z, 802.1p, 802.1q and 802.3x standards. The built-in management module allows users to configure this Managed Industrial Gigabit Ethernet Switch and monitor the operation status locally or remotely through network.

Besides, redundant power supplies are offered on the Managed Industrial Gigabit Ethernet Switches for users to create a reliable and stable network in the event of power failure. By employing store and forward switching mechanism, the Switch provides low latency and faster data transmission. Moreover, it also supports advanced functions such as VLAN and QoS. Users can configure the required settings of the Switch and monitor its real-time operational status via Command Line Interface (CLI).

1.1 Management Preparations

The Managed Industrial Gigabit Ethernet Switch can be accessed through both Telnet connection and a web browser such as Internet Explorer, Google Chrome or Firefox, etc. Before you can access the Managed Industrial Gigabit Ethernet Switch and configure it, you need to connect cables properly.

1.1.1 Connecting the Managed Industrial Switch

It is extremely important that proper cables are used with correct pin arrangements when connecting the Managed Industrial Gigabit Ethernet Switch to other devices such as switches, hubs, workstations, etc.

- **1000Base-X Fiber Port or 100/1000 Base-X Fiber Port**

The 1000Base-X fiber port(s) are located at the front panel of the Managed Industrial Gigabit Ethernet Switch. These port(s) are primarily used for uplink connection and can operate at 100/100Mbps or 1000Mbps Full or Half Duplex mode. Duplex SC or WDM Simplex SC types of connectors are available. Use proper multi-mode or single-mode optical fiber cable to connect these port(s) with the other Ethernet Fiber port.

Before connecting to other switches, workstations or media converters, make sure both sides of the fiber transfer are with the same media type, for example 1000Base-X Single-mode to 1000Base-X Single-mode, 1000Base-X Multi-mode to 1000Base-X Multi-mode. Check that the fiber-optic cable type matches the fiber transfer model. To connect to 1000Base-SX transfer, use the multimode fiber cable (one side must be male duplex SC connector type). To connect to 1000Base-LX transfer, use the single-mode fiber cable (one side must be male duplex LC connector type).

- **10/100/1000Base-T RJ-45 Ports**

8 10/100/1000Base-T RJ-45 ports are located on the front panel of the Managed Industrial Gigabit Ethernet Switch. These RJ-45 ports allow users to connect their traditional copper-based Ethernet devices to network. All these ports support auto-negotiation and MDI/MDIX auto-crossover, i.e. the crossover or straight through CAT-5 cable may be used.

1.1.2 Assigning IP Addresses

IP addresses have the format n.n.n.n, for example 168.168.8.100.

IP addresses are made up of two parts:

- The first part (168.168.XXX.XXX in the example) indicates network address identifying the network where the device resides. Network addresses are assigned by three allocation organizations. Depending on your location, each allocation organization assigns a globally unique network number to each network that wishes to connect to the Internet.
- The second part (XXX.XXX.8.100 in the example) identifies the device within the network. Assigning unique device numbers is your responsibility. If you are unsure of the IP addresses allocated to you, consult the allocation organization from which your IP addresses were obtained.

Remember that an address can be assigned to only one device on a network. If you connect to the outside, you must change all the arbitrary IP addresses to comply with those you have been allocated by the allocation organization. If you do not do this, your outside communications will not be connected.

A subnet mask is a filtering system for IP addresses. It allows you to further subdivide your network. You must use the proper subnet mask for a proper operation of a network with subnets defined.

1.2 LED Definitions

| LED | Definition | Color | Operation |
|------------------|---------------|-----------------|--|
| P1 | Power | Off | Device is powered down. |
| | | Green | Device is powered on. |
| P2 | Power | Off | Device is powered down. |
| | | Green | Device is powered on. |
| STATUS | System Status | Orange | System is booting up. |
| | | Green | System is working normally. |
| | | Green Blinking | When a USB is inserted, the Status LED indicator will blink 3 times in green. |
| | | | When upgrade procedure is completed, the Status LED indicator will blink 3 times in green. |
| | | Orange Blinking | When the system is set back to default factory setting, the Status LED indicator will blink 3 times in orange. |
| | | | When the system is restarted, the Status LED indicator will blink once in orange. |
| | | | System is undergoing upgrading procedure. |
| ALM | Alarm | Off | Power supplies link up. |
| | | Orange | One of power supplies links down. |
| RM | Role | Off | The role of switch is slave. |
| | | Green | The role of switch is master. |
| R | Function | Off | Ring Detection is disabled. |
| | | Green | Ring Detection is enabled. |
| LINK/ACT 1~10 | Port Status | Off | Port link is down |
| | | Orange | Link is up and works at 10/100Mbps. |
| | | Orange Blinking | Receiving and transmitting data. |
| | | Green | Link is up and works at 1000Mbps. |
| | | Green Blinking | Receiving and transmitting data. |

2. Command Line Interface (CLI)

This chapter guides you to use Command Line Interface (CLI) via Telnet connection, specifically in:

- Configuring the system
- Resetting the system
- Upgrading newly released firmware

2.1 Remote Console Management-Telnet

You can use Command Line Interface to manage the Managed Industrial Gigabit Ethernet Switch via Telnet session. For first-time users, you must first assign a unique IP address to the Managed Industrial Gigabit Ethernet Switch before you can manage it remotely. Use any one of the RJ-45 ports on the front panel as the temporary management console port to login to the device with the default username & password and then assign the IP address using IP command in Global Configuration Mode.

Follow steps described below to access the Managed Industrial Gigabit Ethernet Switch through Telnet session:

- Step 1.** Use any one of the RJ-45 ports on the front panel as a temporary management console port to login to the Industrial Managed Gigabit Ethernet Switch.
- Step 2.** Run Telnet client and connect to *192.168.0.1*. For first-time users, make sure the IP address of your PC or workstation is assigned to an IP address between 192.168.0.2 and 192.168.0.254 with subnet mask 255.255.255.0.
- Step 3.** When asked for a username, enter “**admin**”. When asked for a password, *leave the password field blank* and press Enter (by default, no password is required.)
- Step 4.** If you enter CLI successfully, the prompt display *Switch>* (the model name of your device together with a greater than sign) will appear on the screen.
- Step 5.** Once you enter CLI successfully, you can set up the Switch’s IP address, subnet mask and the default gateway using “IP” command in Global Configuration Mode. The telnet session will be terminated immediately once the IP address of the Switch has been changed.
- Step 6.** Use new IP address to login to the Managed Industrial Gigabit Ethernet Switch via Telnet session again.

Limitation: Only one active Telnet session can access the Managed Industrial Gigabit Ethernet Switch at a time.

2.2 Navigating CLI

After you successfully access to the Managed Industrial Gigabit Ethernet Switch, you will be asked for a login username. Enter your authorized username and password, and then you will be directed to User Mode. In CLI management, User Mode only provides users with basic functions to operate the Managed Industrial Gigabit Ethernet Switch. If you would like to configure advanced features of the Managed Industrial Gigabit Ethernet Switch, such as VLAN and QoS, you must enter Configuration Mode. The following table provides an overview of modes available in this Managed Industrial Gigabit Ethernet Switch.

| Command Mode | Access Method | Prompt Displayed | Exit Method |
|--------------------|---|------------------|-----------------------|
| User Mode | Login username & password | Switch> | logout |
| Privileged Mode | From User Mode, enter the <i>enable</i> command | Switch# | disable, exit, logout |
| Configuration Mode | From Privileged Mode, enter the <i>config</i> or <i>configure</i> command | Switch(config)# | exit |

NOTE: By default, the model name will be used for the prompt display. For convenience, the prompt display “Switch” will be used throughout this user’s manual.

2.2.1 General Commands

This section introduces you some general commands that you can use in all modes, including “help”, “exit”, “history” and “logout”.

| Entering the command... | To do this... | Available Modes |
|-------------------------|--|--|
| help | Obtain a list of available commands in the current mode. | User Mode Privileged Mode Configuration Mode |
| exit | Return to the previous mode or login screen. | User Mode Privileged Mode Configuration Mode |
| history | List all commands that have been used. | User Mode Privileged Mode Configuration Mode |
| logout | Logout from the CLI or terminate Telnet session. | User Mode Privileged Mode |

2.2.2 Quick Keys

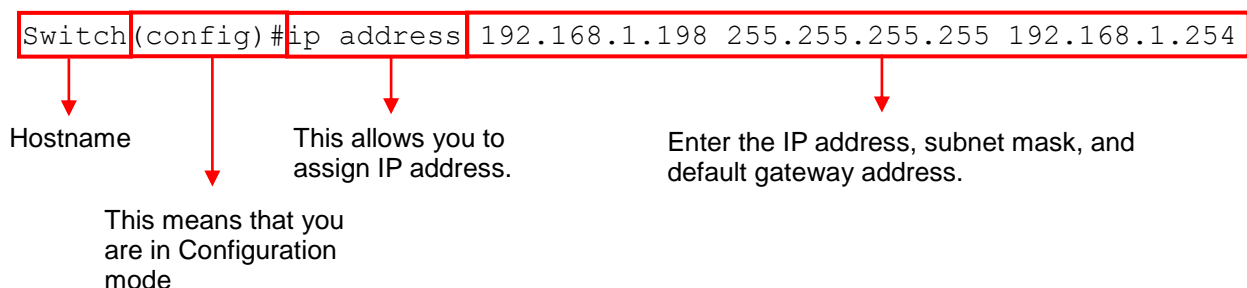

In CLI, there are several quick keys that you can use to perform several functions. The following table summarizes the most frequently used quick keys in CLI.

| Keys | Purpose |
|----------------------------------|--|
| tab | Enter an unfinished command and press “Tab” key to complete the command. |
| ? | Press “?” key in each mode to get available commands. |
| Unfinished command followed by ? | Enter an unfinished command or keyword and press “?” key to complete the command and get command syntax help. Examples: Switch#h? help Show available commands history Show history commands |
| Up arrow | Use Up arrow key to scroll through the previous entered commands, beginning with the most recent key-in commands. |
| Down arrow | Use Down arrow key to scroll through the previous entered commands, beginning with the commands that are entered first. |

2.2.3 Command Format

While in CLI, you will see several symbols often. As mentioned above, you might already know what “>”, “#” and (config)# represent. However, to perform what the device is intended to do, you have to enter a string of complete command correctly. For example, if you want to assign IP address for the Managed Industrial Gigabit Ethernet Switch, you need to enter the following command with the required parameter and IP, subnet mask and default gateway:

IP command syntax: Switch(config)#ip address [A.B.C.D] [255.X.X.X] [A.B.C.D]

The following table lists common symbols and syntax that you will see frequently in this User's Manual for your reference:

| Symbols | Brief Description |
|---------------------------------------|--|
| > | Currently, the device is in User Mode. |
| # | Currently, the device is in Privileged Mode. |
| (config)# | Currently, the device is in Configuration Mode. |
| Syntax | Brief Description |
| [] | Brackets mean that this field is required information. |
| [A.B.C.D] | Brackets represent that this is a required field. Enter an IP address or gateway address. |
| [255.X.X.X] | Brackets represent that this is a required field. Enter the subnet mask. |
| [port-based 802.1p dscp vid] | There are four options that you can choose. Specify one of them. |
| [1-8191] | Specify a value between 1 and 8191. |
| [0-7] 802.1p_list [0-63] dscp_list | <p>Specify one value, more than one values or a range of values.</p> <p>Example 1: specifying one value</p> <pre>Switch(config)#qos 802.1p-map <u>1</u> 0 Switch(config)#qos dscp-map <u>10</u> 3</pre> <p>Example 2: specifying more than one values (separated by commas)</p> <pre>Switch(config)#qos 802.1p-map <u>1,3</u> 0 Switch(config)#qos dscp-map <u>10,13,15</u> 3</pre> <p>Example 3: specifying a range of values (separating by a hyphen)</p> <pre>Switch(config)#qos 802.1p-map <u>1-3</u> 0 Switch(config)#qos dscp-map <u>10-15</u> 3</pre> |

2.2.4 Login Username & Password

Default Login

After you enter Telnet session, a login prompt will appear to request a valid and authorized username and password combination. For first-time users, enter the default login username “**admin**” and “**press Enter key**” in password field (no password is required for default setting). When system prompt shows “Switch>”, it means that the user has successfully entered User mode.

For security reasons, it is strongly recommended that you add a new login username and password using User command in Configuration mode. When you create your own login username and password, you can delete the default username (admin) to prevent unauthorized accesses.

Forgot Your Login Username & Password?

If you forgot your login username and password, you can use the “reset button” to set all configurations back to factory defaults. Once you have performed system setting to defaults, you can login with default username and password. Please note that if you use this method to gain access to the Managed Industrial Gigabit Ethernet Switch, all configurations saved in Flash will be lost. It is strongly recommended that a copy of configurations is backed up in your local hard-drive or file server from time to time so that previously-configured settings can be restored to the Managed Industrial Gigabit Ethernet Switch for use after you gain access again to the device.

2.3 User Mode

In User mode, only a limited set of commands is provided. Please note that in Use mode, you have no authority to configure advanced settings. You need to enter Privileged mode or Configuration mode to set up advanced functions of a switch feature. For a list of commands available in User mode, enter the question mark (?) or “help” command after the system prompt displays “Switch>”.

| Command | Description |
|---------|---|
| exit | Quit User mode and close the terminal connection. |
| help | Display a list of available commands in User mode. |
| history | Display the command history. |
| logout | Logout from the Managed Industrial Gigabit Ethernet Switch. |
| enable | Enter Privileged mode. |

2.4 Privileged Mode

The only place where you can enter Privileged (Enable) mode is User mode. When you successfully enter Enable mode, the prompt will be changed to Switch# (the model name of your device together with a pound sign). Enter the question mark (?) or help command to view a list of commands available for use.

| Command | Description |
|-----------|---|
| copy-cfg | Restore or backup configuration file. |
| disable | Exit Enable mode and return to User mode |
| exit | Exit Enable mode and return to User mode. |
| firmware | Upgrade Firmware via FTP or TFTP server. |
| help | Display a list of available commands in Enable mode. |
| history | Show commands that have been used. |
| logout | Logout from the Managed Industrial Gigabit Ethernet Switch. |
| reload | Restart the Managed Industrial Gigabit Ethernet Switch. |
| write | Save the current configurations to Flash. |
| configure | Enter Global Configuration mode |
| show | Display the system information. |

2.4.1 Copy-cfg Command

Use the “copy-cfg” command to restore the Managed Industrial Gigabit Ethernet Switch back to the defaults or to the defaults without changing IP configurations, backup a configuration file to FTP or TFTP server, or restore a configuration file via FTP or TFTP server.

1. To restore a configuration file via FTP or TFTP server:

| Command | Parameter | Description |
|--|-------------|---|
| Switch# copy-cfg from ftp [A.B.C.D] [file name] [user_name] [password] | [A.B.C.D] | Enter the IP address of your FTP server. |
| | [file_name] | Enter the configuration file name that you want to restore. |
| | [user_name] | Enter the username for FTP server login. |
| | [password] | Enter the password for FTP server login. |
| Switch# copy-cfg from tftp [A.B.C.D] [file_name] | [A.B.C.D] | Enter the IP address of your TFTP server. |
| | [file_name] | Enter the configuration file name that you want to restore. |
| Example | | |
| Switch# copy-cfg from ftp 192.168.1.198 HS_0600_file.conf misadmin1 abcxyz | | |
| Switch# copy-cfg from tftp 192.168.1.198 HS_0600_file.conf | | |

2. To restore the Managed Industrial Gigabit Ethernet Switch back to default settings:

Command / Example

Switch# copy-cfg from default

NOTE: There are two ways to set the Managed Industrial Gigabit Ethernet Switch back to the factory default settings. Users can use the “copy-cfg from default” command in CLI or simply press the “Reset Button” located on the front panel to restore the device back to the initial state.

3. To restore the Managed Industrial Gigabit Ethernet Switch back to default settings except the network setting:

Command / Example

Switch# copy-cfg from default keep-ip

4. To backup a configuration file to FTP or TFTP server:

| Command | Parameter | Description |
|---|-------------|--|
| Switch# copy-cfg to ftp [A.B.C.D] [file_name] [user_name] [password] | [A.B.C.D] | Enter the IP address of your FTP server. |
| | [file_name] | Enter the configuration file name that you want to backup. |
| | [user_name] | Enter the username for FTP server login. |
| | [password] | Enter the password for FTP server login. |
| Switch# copy-cfg to tftp [A.B.C.D] [file_name] | [A.B.C.D] | Enter the IP address of your TFTP server. |
| | [file_name] | Enter the configuration file name that you want to backup. |
| Example | | |
| Switch# copy-cfg to ftp 192.168.1.198 HS_0600_file.conf misadmin1 abcxyz | | |
| Switch# copy-cfg to tftp 192.168.1.198 HS_0600_file.conf | | |

2.4.2 Firmware Command

To upgrade the firmware via FTP or TFTP server, use the “firmware” command.

| Command | Parameter | Description |
|--|-------------|--|
| Switch# firmware upgrade ftp [A.B.C.D] [file_name] [user_name] [password] | [A.B.C.D] | Enter the IP address of your FTP server. |
| | [file_name] | Enter the firmware file name that you want to upgrade. |
| | [user_name] | Enter the username for FTP server login. |
| | [password] | Enter the password for FTP server login. |
| Switch# firmware | [A.B.C.D] | Enter the IP address of your TFTP server. |

| | | |
|--|-------------|--|
| upgrade tftp [A.B.C.D] [file_name] | [file_name] | Enter the firmware file name that you want to upgrade. |
| Example | | |
| Switch# firmware upgrade ftp 192.168.1.198 HS_0600_file.bin edgswitch10 abcxyz | | |
| Switch# firmware upgrade tftp 192.168.1.198 HS_0600_file.bin | | |

2.4.3 Reload Command

To restart the Managed Industrial Gigabit Ethernet Switch by image 1 or 2, use the “reload” command.

| Command / Example |
|------------------------|
| Switch# reload image-1 |
| Switch# reload image-2 |

2.4.4 Write Command

To save running configurations to startup configurations, use the “write” command. All unsaved configurations will be lost when you restart the Managed Industrial Gigabit Ethernet Switch.

| Command / Example |
|-------------------|
| Switch# write |

2.4.5 Configure Command

You can enter Configuration mode only from Privileged mode. You can type in “configure” or “config” to enter Configuration mode. The display prompt will change from “Switch#” to “Switch(config)#” once you successfully enter Configuration mode.

| Command / Example |
|--------------------------------------|
| Switch# config Switch(config)# |
| Switch# configure Switch(config)# |

2.5 Global Configuration Mode

When you enter “configure” or “config” and press “Enter” in Privileged mode, you will be directed to Global Configuration mode where you can set up advanced switching functions, such as QoS and VLAN. Any command entered will be applied to the running-configuration and device’s operation. From this level, you can also enter different sub-configuration modes to set up specific configurations for VLAN, QoS or interfaces.

| Command | Description |
|----------------|--|
| channel-group | Link Aggregation/LACP global configuration commands |
| dot1x | IEEE 802.1X global configuration commands |
| exit | Exit from Global Configuration mode. |
| help | Display a list of available commands. |
| history | Show commands that have been used. |
| ip | Global IP configuration commands |
| lldp | LLDP global configuration mode |
| loop-detection | Configure loop-detection to prevent loop between switch ports by locking them. |
| mac | Global MAC configuration commands |
| management | Manage the interface configuration. |
| mirror | Set up target port for mirroring. |
| ntp | Set up required configurations for Network Time Protocol. |
| qos | Set up the priority of packets within the Managed Industrial Switch. |
| security | Set up storm control settings. |
| snmp-server | Create a new SNMP community and trap destination and specify the trap types. |
| spanning-tree | Set up RSTP status of each port and aggregated ports. |
| switch | Switch Global configuration commands |
| switch-info | Switch information configuration commands |
| syslog | Set up required configurations for Syslog server. |
| ring-detection | Set up Ring Detection commands. |
| time-range | Set up a specific period of time for an event. |
| user | User Account management |
| vlan | Set up VLAN mode and VLAN configuration. |
| no | Negate a command or set it back to its default setting. |
| interface | Select one or a range of interfaces to configure. |
| show | Display the system information. |

2.5.1 Entering Interface Numbers

In Configuration mode, you can configure a command that is only applied to designated interfaces. For example, you can set up each interface's VLAN assignment, speed, or duplex mode. For configuring, you must first enter the interface number. There are four ways to enter your interface numbers to signify the combination of different interfaces that apply to a command or commands.

| Commands | Description |
|---|--|
| Switch(config)# interface 1 Switch(config-if-1)# | Enter a single interface. Only interface 1 will apply to commands entered. |
| Switch(config)# interface 1,3,5 Switch(config-if-1,3,5)# | Enter three discontinuous interfaces, separating by a comma. Interface 1, 3, 5 will apply to commands entered. |
| Switch(config)# interface 1-3 Switch(config-if-1-3)# | Enter three continuous interfaces. Use a hyphen to signify a range of interface numbers. In this example, interface 1, 2, and 3 will apply to commands entered. |
| Switch(config)# interface 1,3-5 Switch(config-if-1,3-5)# | Enter a single interface number together with a range of interface numbers. Use both commas and hyphens to signify the combination of different interface numbers. In this example, interface 1, 3, 4, 5 will apply to commands entered. |

The "interface" command can be used together with "Loop Detection", "QoS", "VLAN" and "Security" commands. For detailed usages, please refer to Loop Detection, QoS, VLAN and Security sections below.

2.5.2 No Command

Most commands that you enter in Configuration mode can be negated by "no" command following the same or original command. The purpose of "no" command is to disable a function, remove a command, or configure the setting back to the default value. In each sub-section below, the use of no command to fulfill different purposes will be introduced.

2.5.3 Show Command

The "show" command is very important for network administrators to get information about the device, receive outputs to verify a command's configurations, or troubleshoot a network configuration error. The show command can be used in Privileged or Configuration mode. Different uses of the show command are described as below:

1. Displaying system information

Enter the “show switch-info” command in Privileged or Configuration mode, and then the following similar screen page will appear.

```

```

Company Name: Display a company name for this Managed Industrial Gigabit Ethernet Switch. Use the “switch-info company-name [company-name]” command to edit this field.

System Object ID: Display the predefined System OID.

System Contact: Display the contact information for this Managed Industrial Gigabit Ethernet Switch. Use the “switch-info sys-contact [sys-contact]” command to edit this field.

System Name: Display a descriptive system name for this Managed Industrial Gigabit Ethernet Switch. Use the “switch-info sys-name [sys-name]” command to edit this field.

System Location: Display a brief location description for this Managed Industrial Gigabit Ethernet Switch. Use the “switch-info sys-location [sys-location]” command to edit this field.

Model Name: Display the model name of the device.

Host Name: Display the host name of the device.

DHCP Vendor ID: Display the DHCP Vendor ID of the device.

Current Boot Image: Display the image in use.

Configured Boot Image: Display the image which would be used after rebooting.

Image-1 Version: Display the firmware version used in image-1.

Image-2 Version: Display the firmware version used in image-2.

M/B Version: Display the main board version.

1000M Port Number: Display the number of ports transmitting at the speed of 1000Mbps

100M Port Number: Display the number of ports transmitting at the speed of 100Mbps

WAN Fiber Type: Display the information about the slide-in fiber type.

WAN Fiber Vendor: Display the vendor of the slide-in fiber.

WAN Fiber PN: Display the PN of the slide-in fiber.

Fiber 2 Type*: Display the information about the slide-in fiber type.

Fiber 2 Vendor*: Display the vendor of the slide-in fiber.

Fiber 2 PN*: Displays the PN of the slide-in fiber.

Serial Number: Display the serial number of this Managed Industrial Gigabit Ethernet Switch.

Date Code: Displays the Managed Industrial Gigabit Ethernet Switch Firmware date code.

Uptime: Display the time the device has been up.

Local Time: Display the time of the location where the switch is.

CPU Temperature: Display the current temperature of the CPU.

SWITCH Temperature: Display the current temperature of the device.

POWER Temperature: Display the current temperature of the power in use.

Power 1: Display the status of power A.

Power 2: Display the status of power B.

***Fiber 2 information for 2-fiber model only**

2. Displaying or verifying currently-configured settings

Please refer to “interface command”, “ip command”, “mac command”, “qos command”, “user command”, and “vlan command” sections.

3. Displaying the interface information or statistics

Please refer to “show interface command” and “show sfp information command” sections.

4. Showing default, running and startup configurations

Please refer to “show default-config command”, “show running-config command” and “show start-up-config command” sections.

2.5.4 Channel-group Command

1. Configuring a static link aggregation group (LAG)

| Command | Parameter | Description |
|---|-----------------------------|--|
| Switch(config)# channel-group trunking [group_name] | [group_name] | Specify a name for the link aggregation group. |
| Switch(config)# interface [port_list] Switch(config-if-PORT-PORT)# channel-group trunking [group_name] | [port_list] [group_name] | Use the “interface” command and enter several discontinuous port numbers to assign the selected ports to the specified link aggregation group. |
| No command | | |
| Switch(config)# no channel-group trunking [group_name] | [group_name] | Delete a link aggregation group. |
| Switch(config)# interface [port_list] Switch(config-if-PORT-PORT)# no channel-group trunking | [port_list] | Remove the selected ports from a link aggregation group. |
| Show command | | |
| Switch(config)# show channel-group trunking | | Show or verify link aggregation settings including aggregated port numbers and load-balancing status. |
| Switch(config)# show channel-group trunking [group_name] | [group_name] | Show or verify a specific link aggregation group’s settings including port numbers and load-balancing status. |
| Example | | |
| Switch(config)# channel-group trunking corenetwork | | Create a link aggregation group called “corenetwork”. |
| Switch(config)# interface 1,2,3 Switch(config-if-1-3)#channel-group trunking corenetwork | | Assign port 1, 2 and 3 to the link aggregation group “corenetwork”. |

2. Configuring MAC Quotient

| Command | Parameter | Description |
|--|-----------|---|
| Switch(config)# channel-group type mac-quotient | | Enable distributing packets according to the MAC address. |
| No command | | |
| Switch(config)# no channel- group type mac-quotient | | Disable distributing packets according to the MAC address. |

Here is how it works.

1. Identifying MAC

It checks the last three bits of Source MAC and Dst. MAC and XOR algorithm distributes them.

XOR Algorithm:

$$0 \& 0 = 0$$

$$0 \& 1 = 1$$

$$1 \& 0 = 1$$

$$1 \& 1 = 0$$

Three bits results in eight combinations (0~7), it is used to determine which packet should be sent to.

Example:

Source MAC 11:22:33:44:55:66

↑ The last digit 6 occupies 4 bits (Use the last three bits \Rightarrow 0100)

Dst. MAC 33:44:55:66:77:88

↑ The last digit 8 occupies 4 bits (Use the last three bits \Rightarrow 1000)

XOR Algorithm:

Src. MAC – 1 1 0

Dst. MAC – 0 0 0

Result – 1 1 0 = 6

2. MAC Quotient Distribution

Example 1:

Assume that 2 ports are aggregated

$8(\text{bit})/2(\text{port}) = 4$ (Integer) \Rightarrow each port is evenly distributed 4 types of bit

$8(\text{bit})/2(\text{port}) = 0$ (Remainder) \Rightarrow The first ports will be distributed extra bits, if any

If enabled:

Port 1 will get 4 bits \Rightarrow 0, 1, 2, 3

Port 2 will get 4 bits \Rightarrow 4, 5, 6, 7

Example 2:

Assume that 3 ports are aggregated

$8(\text{bit})/3(\text{port}) = 2$ (Integer) \Rightarrow each port is distributed 2 types of bit at least

$8(\text{bit})/3(\text{port}) = 2$ (Remainder) \Rightarrow The first two ports will be additionally gotten 1 bit respectively

If enabled:

Port 1 will get 3 bits \Rightarrow 0, 1, 2

Port 2 will get 3 bits \Rightarrow 3, 4, 5

Port 3 will get 2 bits \Rightarrow 6, 7

Example 3:

Assume that 6 ports are aggregated

$8(\text{bit})/6(\text{port}) = 1$ (Integer) \Rightarrow each port is distributed 1 type of bit at least

$8(\text{bit})/6(\text{port}) = 2$ (Remainder) \Rightarrow The first two ports will be additionally gotten 1 bit respectively

If enabled:

Port 1 will get 2 bits \Rightarrow 0, 1

Port 2 will get 2 bits \Rightarrow 2, 3

Port 3 will get 1 bit \Rightarrow 4

Port 4 will get 1 bit \Rightarrow 5

Port 5 will get 1 bit \Rightarrow 6

Port 6 will get 1 bit \Rightarrow 7

3. Disabling MAC Quotient

If MAC Quotient is disabled, 8 types of bit are distributed in order.

Example 1

Assume that 2 ports are aggregated

Port 1 will get 4 bits \Rightarrow 0, 2, 4, 6

Port 2 will get 4 bits \Rightarrow 1, 3, 5, 7

Example 2

Assume that 3 ports are aggregated

Port 1 will get 3 bits \Rightarrow 0, 3, 6

Port 2 will get 3 bits \Rightarrow 1, 4, 7

Port 3 will get 2 bits \Rightarrow 2, 5

3. Use “Interface” command to configure link aggregation groups dynamically (LACP).

| Channel-group & Interface command | Parameter | Description |
|---------------------------------------|-------------|----------------------------------|
| Switch(config)# interface [port_list] | [port_list] | Enter several discontinuous port |

| | | |
|--|----------|--|
| | | numbers separated by commas or a range of ports with a hyphen. For example:1,3 or 2-4 |
| Switch(config-if-PORT-PORT)# channel-group lacp | | Enable LACP on the selected interfaces. The Managed Switch supports dynamic Link Aggregation Control Protocol (LACP) which is specified in IEEE 802.3ad. Static trunks have to be manually configured at both ends of the link. In other words, LACP configured ports can automatically negotiate a trunked link with LACP configured ports on other devices. You can configure any number of ports on the Managed Switch as LACP, as long as they are not already configured as part of a static trunk. If ports on other devices are also configured as LACP, the Managed Switch and the other devices will negotiate a trunk link between them. If an LACP trunk consists of more than four ports, all other ports will be placed in a standby mode. Should one link in the trunk fail, one of the standby ports will automatically be activated to replace it. |
| Switch(config-if-PORT-PORT)# channel-group lacp key [0-255] | [0-255] | Specify a key to the selected interfaces. Ports in an aggregated link group must have the same LACP port Key. In order to allow a port to join an aggregated group, the port Key must be set to the same value. The range of key value is between 0 and 255. When key value is set to 0, the port Key is automatically set by the Managed Switch. |
| Switch(config-if-PORT-PORT)# channel-group lacp type [active] | [active] | Specify the selected interfaces to active LACP role. “Active” Port Role: Active LACP ports are capable of processing and sending LACP control frames. This allows LACP compliant devices to negotiate the aggregated link so that the group may be changed dynamically as required. In order to utilize the ability to change an aggregated port group, that is, to add or remove ports from the group, at |

| | | |
|--|-------------|--|
| | | <p>least one of the participating devices must designate LACP ports as active. Both devices must support LACP.</p> <p>“Passive” Port Role: LACP ports that are designated as passive cannot initially send LACP control frames. In order to allow the linked port group to negotiate adjustments and make changes dynamically, one end of the connection must have “active” LACP ports.</p> |
| No command | | |
| Switch(config-if-PORT-PORT)# no channel-group lacp | | Disable LACP on the selected interfaces. |
| Switch(config-if-PORT-PORT)# no channel-group lacp key | | Reset the key value of the selected interfaces to the factory default. |
| Switch(config-if-PORT-PORT)# no channel-group lacp role | | Reset the LACP type of the selected interfaces to the factory default (passive mode). |
| Show command | | |
| Switch(config)# show channel-group lacp | | Show or verify each interface’s LACP settings including current mode, key value and LACP type. |
| Switch(config)# show channel-group lacp [port_list] | [port_list] | Show or verify the selected interfaces’ LACP settings. |
| Switch(config)# show channel-group lacp status | | Show or verify each interface’s current LACP status. |
| Switch(config)# show channel-group lacp status [port_list] | [port_list] | Show or verify the selected interfaces’ current LACP status. |
| Switch(config)# show channel-group lacp statistics | | Show or verify each interface’s current LACP traffic statistics. |
| Switch(config)# show channel-group lacp statistics [port_list] | [port_list] | Show or verify the selected interfaces’ current LACP statistics. |
| Switch(config)# show channel-group lacp statistics clear | | Clear all LACP statistics. |
| Channel-group & interface command example | | |
| Switch(config)# interface 1-3 | | Enter port 1 to port 3’s interface mode. |
| Switch(config-if-1-3)# channel-group lacp | | Enable LACP on the selected interfaces. |
| Switch(config-if-1-3)# channel-group lacp key 10 | | Set a key value “10” to the selected interfaces. |
| Switch(config-if-1-3)# channel-group lacp role active | | Set the selected interfaces to active LACP type. |

2.5.5 Dot1X Command

| Command | Parameter | Description |
|--|-----------------|--|
| Switch(config)# dot1x | | Enable dot1x function. When enabled, the Managed Switch acts as a proxy between the 802.1X-enabled client and the authentication server. In other words, the Managed Switch requests identifying information from the client, verifies that information with the authentication server, and relays the response to the client. |
| Switch(config)# dot1x reauth-period [0-3600] | [0-3600] | Specify a period of authentication time that a client authenticates with the authentication server. The allowable value is between 0 and 3600 seconds. |
| Switch(config)# dot1x reauthentication | | Enable re-authentication function. |
| Switch(config)# dot1x secret [shared_secret] | [shared_secret] | Specify a shared secret of up to 30 characters. This is the identification word or number assigned to each RADIUS authentication server with which the client shares a secret. |
| Switch(config)# dot1x server [A.B.C.D] | [A.B.C.D] | Specify the RADIUS Authentication server IP address. |
| Switch(config)# dot1x timeout [1-255] | [1-255] | Specify the time value in seconds. The Managed Switch will wait for a period of time for the response from the authentication server to an authentication request before it times out. The allowable value is between 1 and 255 seconds. |
| No command | | |
| Switch(config)# no dot1x | | Disable IEEE 802.1x function. |
| Switch(config)# no dot1x reauth-period | | Reset the re-authentication period value back to the default setting (60 seconds). |
| Switch(config)# no dot1x reauthentication | | Disable re-authentication function. |
| Switch(config)# no dot1x secret | | Remove the original shared secret. |
| Switch(config)# no dot1x server | | Remove the specified server IP address. |
| Switch(config)# no dot1x timeout | | Reset the timeout value back to the default setting (10 seconds). |

| | | |
|---|-------------|--|
| Show command | | |
| Switch(config)# show dot1x | | Show or verify 802.1x settings. |
| Switch(config)# show dot1x interface | | Show or verify each interface's 802.1x settings including port status and authentication status. |
| Switch(config)# show dot1x interface [port_list] | [port_list] | Show or verify the selected interfaces' 802.1x settings including port status and authentication status. |
| Switch(config)# show dot1x statistics | | Show or verify 802.1x statistics. |
| Switch(config)# show dot1x statistics [port_list] | [port_list] | Show or verify the selected interfaces' statistics. |
| Switch(config)# show dot1x status | | Show or verify 802.1x status. |
| Switch(config)# show dot1x status [port_list] | [port_list] | Show or verify the selected interfaces' 802.1x status. |
| Dot1x command example | | |
| Switch(config)# dot1x | | Enable IEEE 802.1x function. |
| Switch(config)# dot1x reauth-period 3600 | | Set the reauthentication period to 3600 seconds. |
| Switch(config)# dot1x reauthentication | | Enable re-authentication function. |
| Switch(config)# dot1x secret agagabcxyz | | Set the shared secret to "agagabcxyz" |
| Switch(config)# dot1x server 192.168.1.10 | | Set the 802.1x server IP address to 192.168.1.10. |
| Switch(config)# dot1x timeout 120 | | Set the timeout value to 120 seconds. |

Use "Interface" command to configure a group of ports' IEEE 802.1x settings.

| Command | Parameter | Description |
|---|-------------|---|
| Switch(config)# interface [port_list] | [port_list] | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For example:1,3 or 2-4 |
| Switch(config-if-PORT-PORT)# dot1x port-control [auto unauthorized] | | Specify the selected ports to "auto" or "unauthorized". "auto" : This requires 802.1X-aware clients to be authorized by the authentication server. Accesses from clients that are not dot1x aware will be denied. "unauthorized" : This forces the Managed Switch to deny access to all |

| | | |
|--|-------------|--|
| | | clients, neither 802.1X-aware nor 802.1X-unaware. |
| Switch(config-if-PORT-PORT)# dot1x reauthenticate | | Re-authenticate the selected interfaces. |
| No command | | |
| Switch(config)# interface [port_list] | [port_list] | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For example:1,3 or 2-4 |
| Switch(config-if-PORT-PORT)# no dot1x port-control | | Reset the selected interfaces' 802.1x state to the factory default (authorized state). |
| Show command | | |
| Switch(config)# show dot1x | | Show or verify 802.1x settings. |
| Switch(config)# show dot1x interface | | Show or verify each interface's 802.1x settings including port status and authentication status. |
| Switch(config)# show dot1x interface [port_list] | [port_list] | Show or verify the selected interfaces' 802.1x settings including port status and authentication status. |
| Switch(config)# show dot1x statistics | | Show or verify 802.1x statistics. |
| Switch(config)# show dot1x statistics [port_list] | [port_list] | Show or verify the selected interfaces' statistics. |
| Switch(config)# show dot1x status | | Show or verify 802.1x status. |
| Switch(config)# show dot1x status [port_list] | [port_list] | Show or verify the selected interfaces' 802.1x status. |
| Dot1x & interface command example | | |
| Switch(config)# interface 1-3 | | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For example:1,3 or 2-4 |
| Switch(config-if-1-3)# dot1x port-control auto | | Set the selected ports to "auto" state. |
| Switch(config-if-1-3)# dot1x reauthenticate | | Re-authenticate the selected interfaces immediately. |

2.5.6 IP Command

1. To set up or remove the IP address of the Managed Industrial Switch:

| IP command | Parameter | Description |
|--------------------------------------|-------------|--|
| Switch(config)# ip address [A.B.C.D] | [A.B.C.D] | Enter the desired IP address for the Managed Industrial Gigabit Ethernet Switch. |
| [A.B.C.D] | [255.X.X.X] | Enter subnet mask of your IP address. |
| [255.X.X.X] | [A.B.C.D] | Enter the default gateway address. |

| | | |
|--|--|--|
| [A.B.C.D] | | |
| No command | | |
| Switch(config)# no ip address | Remove the configured IP settings and set back to defaults. | |
| Show command | | |
| Switch(config)# show ip address | Show the current IP configurations or verify the configured IP settings. | |
| IP command example | | |
| Switch(config)# ip address 192.168.1.198 255.255.255.0 192.168.1.254 | Set up the Switch's IP to 192.168.1.198, subnet mask to 255.255.255.0, and default gateway to 192.168.1.254. | |

2. To enable the Managed Industrial Switch to automatically get IP address from the DHCP server:

| Command / Example | Description |
|------------------------------------|--|
| Switch(config)# ip address dhcp | Enable DHCP mode. |
| No command | |
| Switch(config)# no ip address dhcp | Disable DHCP mode. |
| Show command | |
| Switch(config)# show ip address | Show the current IP configurations or verify the configured IP settings. |

3. Enable or disable IGMP snooping globally.

IGMP, Internet Group Management Protocol, is a communications protocol used to manage the membership of Internet Protocol multicast groups. IGMP is used by IP hosts and adjacent multicast routers to establish multicast group memberships. It can be used for online streaming video and gaming, and allows more efficient use of resources when supporting these uses.

IGMP Snooping is the process of listening to IGMP traffic. IGMP snooping, as implied by the name, is a feature that allows the switch to “listen in” on the IGMP conversation between hosts and routers by processing the layer 3 packets IGMP packets sent in a multicast network.

When IGMP snooping is enabled in a switch, it analyses all the IGMP packets between hosts connected to the switch and multicast routers in the network. When a switch hears an IGMP report from a host for a given multicast group, the switch adds the host's port number to the multicast list for that group. And, when the switch hears an IGMP Leave, it removes the host's port from the table entry.

IGMP snooping can very effectively reduce multicast traffic from streaming and other bandwidth intensive IP applications. A switch using IGMP snooping will only forward multicast traffic to the hosts interested in that traffic. This reduction of multicast traffic reduces the packet processing at the switch (at the cost of needing additional memory to handle the

multicast tables) and also reduces the workload at the end hosts since their network cards (or operating system) will not have to receive and filter all the multicast traffic generated in the network.

| Command / Example | Parameter | Description |
|--|--------------------|--|
| Switch(config)# ip igmp snooping | | Enable IGMP snooping function. |
| Switch(config)# ip igmp snooping aging-time [1-3000] 1/10 secs | [1-3000] 1/10 secs | Specify the IGMP querier aging time. If the switch does not receive join packets from the end device within the specified time, the entry associated with this end device will be removed from the IGMP table. The default setting is "1200" 1/10 seconds. |
| No command | | |
| Switch(config)# no ip igmp snooping | | Disable IGMP snooping function. |
| Switch(config)# no ip igmp snooping aging time | | Remove IGMP querier aging time setting. |
| Show command | | |
| Switch(config)# show ip igmp snooping | | Show current IGMP snooping status including immediate leave function. |
| Switch(config)# show ip igmp snooping groups | | Show IGMP group table. When IGMP Snooping is enabled, the Switch is able to read multicast group IP and the corresponding MAC address from IGMP packets that enter the device. |

4. Enable or disable IGMP snooping immediate-leave function.

This works only when IGMP Snooping is enabled. When Immediate Leave is enabled, the Switch immediately removes the port when it detects IGMPv1 & IGMPv2 leave message on that port.

| Command | Description |
|---|---|
| Switch(config)# ip igmp snooping immediate-leave | Enable IGMP immediate leave function. |
| No command | |
| Switch(config)# no ip igmp snooping immediate-leave | Disable IGMP immediate leave function. |
| Show command | |
| Switch(config)# show ip igmp snooping | Show current IGMP snooping status including immediate leave function. |
| Switch(config)# show ip igmp snooping groups | Show IGMP group table. |

5. Configure multicast router ports.

| Command | Parameter | Description |
|---------|-----------|-------------|
|---------|-----------|-------------|

| | | |
|---|-------------|---------------------------------|
| Switch(config)# ip igmp snooping mcast-router [port_list] | [port_list] | Specify multicast router ports. |
|---|-------------|---------------------------------|

6. Configure IGMP Snooping for specific VLAN

| Command | Parameter | Description |
|---|-----------|--|
| Switch(config)# ip igmp snooping vlan [1-4094] | [1-4094] | Enable IGMP snooping for specific VLAN. |
| Switch(config)# ip igmp snooping vlan [1-4094] query | | Enable querier for specific VLAN. |
| No Command | | Description |
| Switch(config)# ip igmp snooping vlan [1-4094] | [1-4094] | Disable IGMP snooping for specific VLAN. |
| Switch(config)# ip igmp snooping vlan [1-4094] query | | Disable querier for specific VLAN. |
| Show command | | |
| Switch(config)# show ip igmp snooping | | Show current IGMP snooping status. |
| Switch(config)# show ip igmp snooping groups | | Show IGMP group table. |

2.5.7 LLDP Command

LLDP stands for Link Layer Discovery Protocol and runs over data link layer. It is used for network devices to send information about themselves to other directly connected devices on the network. By using LLDP, two devices running different network layer protocols can learn information about each other. A set of attributes are used to discover neighbor devices. These attributes contains type, length, and value descriptions and are referred to TLVs. Details such as port description, system name, system description, system capabilities, and management address can be sent and received on this Managed Switch. Use Spacebar to select "ON" if you want to receive and send the TLV.

| Command | Parameter | Description |
|---|-----------|--|
| Switch(config)# lldp hold-time [1-3600] | [1-3600] | Specify the amount of time in seconds. A receiving device will keep the information sent by your device for a period of time you specify here before discarding it. The allowable hold-time value is between 1 and 3600 seconds. |
| Switch(config)# lldp initiated-delay [0-300] | [0-300] | Specify a period of time the Managed Switch will wait before the initial LLDP packet is sent. The allowable initiated-delay value is between 0 and 300 seconds. |
| Switch(config)# lldp interval [1-180] | [1-180] | Specify the time interval for updated LLDP packets to be sent. The allowable interval value is between 1 and 180 seconds. |

| | | |
|---|--------|--|
| Switch(config)# lldp packets [1-16] | [1-16] | Specify the amount of packets that are sent in each discovery. The allowable packet value is between 1 and 16 seconds. |
| Switch(config)# lldp tlv-select capability | | Enable Capability attribute to be sent. |
| Switch(config)# lldp tlv-select management-address | | Enable Management Address attribute to be sent. |
| Switch(config)# lldp tlv-select port-description | | Enable Port Description attribute to be sent. |
| Switch(config)# lldp tlv-select system-description | | Enable System Description attribute to be sent. |
| Switch(config)# lldp tlv-select system-name | | Enable System Name attribute to be sent. |
| No command | | |
| Switch(config)# no lldp hold-time | | Reset the hold-time value back to the default setting. |
| Switch(config)# no lldp initiated-delay | | Reset the initiated-delay value back to the default setting. |
| Switch(config)# no lldp interval | | Reset the interval value back to the default setting. |
| Switch(config)# no lldp packets | | Reset the packets-to-be-sent value back to the default setting. |
| Switch(config)# no lldp tlv-select capability | | Disable Capability attribute to be sent. |
| Switch(config)# no lldp tlv-select management-address | | Disable Management Address attribute to be sent. |
| Switch(config)# no lldp tlv-select port-description | | Disable Port Description attribute to be sent. |
| Switch(config)# no lldp tlv-select system-description | | Disable System Description attribute to be sent. |
| Switch(config)# no lldp tlv-select system-name | | Disable System Name attribute to be sent. |
| Show command | | |
| Switch(config)# show lldp | | Show or verify LLDP settings. |
| Switch(config)# show lldp interface | | Show or verify each interface's LLDP port state. |
| Switch(config)# show lldp interface [port_list] | | Show or verify the selected interfaces' LLDP port state. |
| Switch(config)# show lldp status | | Show current LLDP status. |
| LLDP command example | | |
| Switch(config)# lldp hold-time 60 | | Set the hold-time value to 60 seconds. |
| Switch(config)# lldp initiated-delay 60 | | Set the initiated-delay value to 60 seconds |
| Switch(config)# lldp interval 10 | | Set the updated LLDP packets to be sent in very 10 seconds. |
| Switch(config)# lldp packets 2 | | Set the number of packets to be sent in each discovery to 2. |
| Switch(config)# lldp tlv-select capability | | Enable Capability attribute to be sent. |
| Switch(config)# lldp tlv-select | | Enable Management Address attribute to be sent. |

| | |
|--|---|
| management-address | |
| Switch(config)# lldp tlv-select port-description | Enable Port Description attribute to be sent. |
| Switch(config)# lldp tlv-select system-description | Enable System Description to be sent. |
| Switch(config)# lldp tlv-select system-name | Enable System Name to be sent. |

Use “Interface” command to configure a group of ports’ LLDP settings.

| LLDP & Interface command | Parameter | Description |
|---------------------------------------|-------------|--|
| Switch(config)# interface [port_list] | [port_list] | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For example:1,3 or 2-4 |
| Switch(config-if-PORT-PORT)# lldp | | Enable LLDP on the selected interfaces. |
| No command | | |
| Switch(config-if-PORT-PORT)# no lldp | | Disable LLDP on the selected interfaces. |
| Show command | | |
| Switch(config)# show lldp | | Show or verify LLDP configurations. |

2.5.8 Loop Detection Command

In a real network, it is possible the people misconnect the network cable to incur loop condition. In a worst case, the network is out of service thereafter. This section gives a guide to configure the Loop Detection function of the system to prevent the system from loop.

After a proper setting of Loop Detection function, the system detects loop condition by periodically sending loop detection packet. Once the system receives the loop detection packet from itself, it is claimed that it detects loop condition. Then, the system takes the following 3 actions

1. It blocks the relevant port to prevent broadcast storms. In other words, the system stops forwarding all the traffic via the looped port. However, the system will process the loop detection packet received on the looped port.
2. It slowly blinks the LED of looped port in orange.
3. It periodically sends loop detection packet to detect the existence of loop condition.

When the system does not receives any loop detection packet from itself for a period of configured **Looped port unlock-interval**. The system claims the loop condition disappears. Then, the system takes the following 3 actions

1. It un-blocks the relevant port. In other words, the system normally forwards all the traffic via the relevant port.
2. It stops slowly blinking the LED of looped port in orange.
3. It periodically sends loop detection packet to detect the existence of loop condition.

Note: Under loop condition, the LED of looped port continues to slowly blink orange even the connected network cable is unplugged out of looped port.

| Command | Parameter | Description |
|---|-----------|--|
| Switch(config)# loop-detection | | Enable Loop Detection function. |
| Switch(config)# loop-detection all-vlan | | <p>Check All VLAN box to enable loop detection on all trunk-VLAN-vid configured in VLAN Command (Section 2.6.23)</p> <p>NOTE: When All VLAN check-box is checked, it invalidates the configured "Specific VLAN".</p> |
| Switch(config)# loop-detection interval [1-180] | [0-180] | <p>This is the time interval (in seconds) that the device will periodically send loop detection packets to detect the presence of looped network. The valid range is from 1 to 180 seconds. The default setting is 1 seconds.</p> |
| Switch(config)# loop-detection unlock-interval [1-1440] | [1-1440] | <p>This is the time interval for the system to detect the existence of loop condition. System un-blocks the looped port if it does not receive any loop-detection packet during the configured unlock-interval. The unlock-interval can be set from 1 to 1440 minutes. The default setting is 1440 minutes.</p> <p>Note:</p> <p>1. Be aware that Looped port unlock-interval converted into seconds should be greater than or equal to Detection Interval seconds multiplied by 10. The '10' is a magic number which is for the system to claims the loop detection disappears when the system does not receive the loop-detection packet from itself at least 10 times. In general, it can be summarized by a formula below:</p> $60 * \text{"Looped port unlock-interval"} \geq 10 * \text{"Detection Interval"}$ <p>2. When a port is detected as a looped port, the system keeps the looped port in blocking status until loop situation is gone. In other words, the system stops forwarding all the traffic via the looped port. However,</p> |

| | | |
|---|-------------|---|
| | | <i>the system will process the loop-detection packet received on the looped port.</i> |
| Switch(config)# loop-detection vlan-id [1-4094] | [1-4094] | Set up loop detection on specified VLAN. The maximum number of VLAN ID is up to 4 sets. NOTE: The configured “Specific VLAN” takes effect when All VLAN check-box is unchecked. |
| No command | | |
| Switch(config)# no loop-detection | | Disable Loop Detection function. |
| Switch(config)# no loop-detection all-vlan | | Disable loop detection on all trunk-VLAN-vid. |
| Switch(config)# no loop-detection interval | | Reset Loop Detection time interval to default setting. |
| Switch(config)# no loop-detection unlock-interval | | Reset Loop Detection unlock time interval to default setting. |
| Switch(config)# no loop-detection vlan-id | | Disable loop detection on a specified VLAN. |
| Show command | | |
| Switch(config)# show loop-detection | | Show Loop Detection settings. |
| Switch(config)# show loop-detection status | | Show Loop Detection status of all ports. |
| Switch(config)# show loop-detection status [port_list] | [port_list] | Show Loop Detection status of the ports. |
| Loop Detection command example | | |
| Switch(config)# loop-detection interval 60 | | Set the Loop Detection time interval to 60 seconds. |
| Switch(config)# loop-detection unlock-interval 120 | | Set the Loop Detection unlock time interval to 120 minutes. |
| Switch(config)# loop-detection vlan-id 100 | | Set the Loop Detection VLAN ID to 100. |

Use “Interface” command to configure a group of ports’ Loop Detection settings.

| Dot1x & Interface command | Parameter | Description |
|--|------------------|--|
| Switch(config)# interface [port_list] | [port_list] | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For example:1,3 or 2-4 |
| Switch(config-if-PORT-PORT)# loop-detection | | Enable Loop Detection function on the specific ports. |
| No command | | |
| Switch(config)# interface [port_list] | [port_list] | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For |

| | | |
|--|--|--|
| | | example:1,3 or 2-4 |
| Switch(config-if-PORT-PORT)# no loop-detection | | Disable Loop Detection function on the specific ports. |

2.5.9 MAC Command

Set up the MAC address table aging time. Entries in the MAC address table containing source MAC addresses and their associated ports will be deleted if they are not accessed within the configured aging time.

| MAC Command | Parameter | Description |
|---|-----------|--|
| Switch(config)# mac address-table aging-time [4-900] | [4-900] | Enter the aging time for the MAC address table. The available number is from 4 to 900. The default setting is “300” seconds. |
| No command | | |
| Switch(config)# no mac address-table aging-time | | Set the MAC address table aging time to the default value (300 seconds). |
| Show command | | |
| Switch(config)# show mac aging-time | | Show the current MAC address table aging time. |
| Switch(config)# show mac address-table | | Show the MAC addresses learned by the Managed Industrial Switch |
| Switch(config)# show mac address-table interface [port] | [port] | Show the MAC addresses learned by the selected ports. |
| Switch(config)# show mac address-table top | | Show the first page of the MAC address table. |
| MAC command example | | |
| Switch(config)# mac address-table aging-time 600 | | Set the MAC address table aging time to 600 seconds. |

2.5.10 Management Command

| Management command | Parameter | Description |
|--|----------------------|---|
| Switch(config)# management console timeout [5-300] | [5-300] | Under RS-232 interface, specify the session aging time within the range: 5-300 seconds. The default setting is “300” seconds. |
| Switch(config)# management [ssh telnet web] | [ssh telnet web] | Select the system service type: SSH, telnet or web. |
| Switch(config)# management telnet port [1-65535] | [1-65535] | Specify the telnet port number. The default setting is “23” |
| No command | | |
| Switch(config)# no management [ssh telnet web] | [ssh telnet web] | Set the system service type to Disabled. |
| Switch(config)# no management | | Disable the configured telnet port. |

| | | |
|-----------------------------------|--|---------------------------------------|
| telnet port | | |
| Show command | | |
| Switch(config)# show management | | Show the current system service type. |
| Management command example | | |
| Switch(config)# management ssh | | Enable SSH system service type. |

2.5.11 Mirror Command

| Mirror command | Parameter | Description |
|--|-------------|--|
| Switch(config)# mirror mode [by-port] | [by-port] | Enable mirror mode by-port |
| Switch(config)# mirror source [port_list] | [port_list] | Specify the source port(s) to be mirrored |
| Switch(config)# mirror destination [port] | [port] | Specify the destination port for mirroring |
| No command | | |
| Switch(config)# no mirror mode | | Disable mirror mode |
| Show command | | |
| Switch(config)# show mirror | | Show port mirror information |
| Mirror command example | | |
| Switch(config)# mirror mode by-port Switch(config)# mirror source 1-3 Switch(config)# mirror destination 4 | | Enable mirror mode and set port 4 as mirror destination and port 1-3 as source port. |

2.5.12 NTP Command

Set up required configurations for Network Time Protocol.

| Command | Parameter | Description |
|--|-----------------------------|---|
| Switch(config)# ntp | | Enable the Managed Industrial Gigabit Ethernet Switch to synchronize the time with a time server. |
| Switch(config)# ntp daylight-saving [recurring date] | [recurring date] | Enable the day light saving. |
| Switch(config)# ntp offset [Mm,w,d,hh:mm-Mm,w,d,hh:mm] | [Mm,w,d,hh:mm-Mm,w,d,hh:mm] | Configure the offset of the daylight saving in the recurring mode. Mm=1-12, w=1-5, d=0-6(0=Sun, 6=Sat) hh=0-23, mm=0-59, Days=1-365 |

| | | |
|---|-------------------------------|---|
| Switch(config)# ntp offset [Days, hh:mm-Days, hh:mm] | [Days, hh:mm- Days, hh:mm] | Configure the offset of the daylight saving in the date mode. Mm=1-12, w=1-5, d=0-6(0=Sun, 6=Sat) hh=0-23, mm=0-59, Days=1-365 |
| Switch(config)# ntp server1 [A.B.C.D] | [A.B.C.D] | Specify the primary time server IP address. |
| Switch(config)# ntp server2 [A.B.C.D] | [A.B.C.D] | Specify the secondary time server IP address. |
| Switch(config)# ntp syn- interval [1-8] | [1-8] | Specify the time interval to synchronize the NTP time server. The meanings of the value: 1:1hr, 2:2hrs, 3:3hrs, 4:4hrs, 5:6hrs, 6:8hrs, 7:12hrs, 8:24hrs |
| Switch(config)# ntp time- zone [0-135] | [0-135] | Specify the time zone where the Managed Industrial Switch belongs. Use a command to view the complete code list of 135 time zones. For example, "Switch(config)# ntp time-zone ?" |
| No command | | |
| Switch(config)# no ntp | | Disable the Managed Industrial Switch to synchronize the time with a time server. |
| Switch(config)# no ntp daylight-saving | | Disable the daylight saving function. |
| Switch(config)# no ntp offset | | Set the offset back to the default setting. |
| Switch(config)# no ntp server1 | | Delete the primary time server IP address. |
| Switch(config)# no ntp server2 | | Delete the secondary time server IP address. |
| Switch(config)# no ntp syn-interval | | Set the synchronization interval back to the default setting. |
| Switch(config)# no ntp time-zone | | Set the time-zone setting back to the default setting. |
| Show command | | |
| Switch(config)# show ntp | | Show or verify the current time server settings. |
| NTP command example | | |
| Switch(config)# ntp | | Enable the Managed Industrial Switch to synchronize the time with a time server. |
| Switch(config)# ntp server1 192.180.0.12 | | Set the primary time server IP address to 192.180.0.12. |
| Switch(config)# ntp server2 192.180.0.13 | | Set the secondary time server IP address to 192.180.0.13. |
| Switch(config)# ntp syn-interval 8 | | Set the synchronization interval to 24 hrs. |
| Switch(config)# ntp time-zone 4 | | Set the time zone to GMT-8:00 Vancouver. |

2.5.13 QoS Command

1. To specify the desired QoS mode:

| QoS command | Parameter | Description |
|-------------------------------------|-----------------|---|
| Switch(config)# qos [802.1p dscp] | [802.1p dscp] | Specify the QoS mode. 802.1p: Use the “ <i>qos 802.1p-map [0-7] [0-7]</i> ” command to assign a priority bit to a queue. dscp: Use the “ <i>qos dscp-map [0-63] dscp_list [0-7]</i> ” to assign several DSCP bit values to a queue. |
| No command | | |
| Switch(config)# no qos | | Disable the QoS function. |
| Show command | | |
| Switch(config)# show qos | | Show or verify the QoS configurations. |
| QoS command example | | |
| Switch(config)# qos 802.1p | | Enable QoS function and use 802.1p mode. |
| Switch(config)# qos dscp | | Enable QoS function and use DSCP mode. |

2. To set up the 802.1p priority bit and queue mapping:

| 802.1p-map command | Parameter | Description |
|--|----------------------|--|
| Switch(config)# qos 802.1p-map [0-7] 802.1p_list [0-7] | [0-7] 802.1p_list | Specify the corresponding 802.1p bits to a queue. |
| | [0-7] | Specify a queue to the specified 802.1p bits. |
| No command | | |
| Switch(config)# no qos 802.1p-map [0-7] 802.1p_list | [0-7] 802.1p_list | Set the queue of the specific 802.1p bits back to the default. |
| Show command | | |
| Switch(config)# show qos | | Show or verify QoS configurations. |
| 802.1p-map example | | |
| Switch(config)# qos 802.1p-map 5 3 | | Specify the 802.1p bit 5 to the priority queue 3. |
| Switch(config)# qos 802.1p-map 5-7 3 | | Specify the 802.1p bit 5, 6 and 7 to the priority queue 3. |

3. To set up the DSCP and queue mapping:

| DSCP-map command | Parameter | Description |
|---|---------------------|--|
| Switch(config)# qos dscp-map [0-63] dscp_list [0-7] | [0-63] dscp_list | Specify the corresponding DSCP values to a queue. |
| | [0-7] | Specify the queue to the specified DSCP values. |
| No command | | |
| Switch(config)# no qos dscp-map [0-63] dscp_list | | Set the queue of the specific DSCP values back to the default. |
| Show command | | |
| Switch(config)# show qos | | Show or verify QoS configurations. |
| DSCP-map example | | |
| Switch(config)# qos dscp-map 30 3 | | Specify the DSCP value 30 to the priority queue 3. |
| Switch(config)# qos dscp-map 40,50 3 | | Specify the DSCP value 40 and 50 to the priority queue 3. |

4. To set up the management priority:

| Management-priority command | Parameter | Description |
|---|-----------|---|
| Switch(config)# qos management-priority [0-7] | [0-7] | Specify the management traffic 802.1p bit. |
| No command | | |
| Switch(config)# no qos management-priority | | Set management traffic priority back to the default value which is 0. |
| Management-priority example | | |
| Switch(config)# qos management-priority 4 | | Set the management traffic priority to 4. |

NOTE: To check the setting of management traffic priority, please refer to 2.5.14 VLAN Command.

5. To set up the QoS queuing mode:

| Queuing-mode command | Parameter | Description |
|---|-----------|--|
| Switch(config)# qos queuing-mode [weight] | [weight] | <p>By default, "strict" queuing mode is used. If you want to use "weight" queuing mode, you need to use the "qos queuing-mode weight" command.</p> <p>Strict mode: Traffic assigned to queue 7 will be transmitted first, and the traffic assigned to queue 6 will not be transmitted until queue 7's traffic is all transmitted, and so forth.</p> <p>Weight mode: All queues have fair opportunity of dispatching. Each queue has the specific amount of bandwidth</p> |

| | | |
|---|--|--|
| | | according to its assigned weight. |
| No command | | |
| Switch(config)# no qos queuing-mode | | Set the queuing mode to the strict mode. |
| Show command | | |
| Switch(config)# show qos | | Show or verify QoS configurations. |
| Queuing-mode example | | |
| Switch(config)# qos queuing-mode weight | | Change the queuing mode from Strict to Weight. |

6. To set up queuing weights of the weight mode:

| Queue-weighted command | Parameter | Description |
|---|-----------------------------|---|
| Switch(config)# qos queue-weighted [1:2:3:4:5:6:7:8] | [_:_:_:_:_:_:_] (1-32) | By default, the weights are "1:2:3:4:5:6:7:8". Specify a value from 1 to 32 to each queue. The total amount of the weights cannot be more than 128. |
| No command | | |
| Switch(config)# no qos queue-weighted | | Set the queuing weights back to the default. |
| Show command | | |
| Switch(config)# show qos | | Show or verify QoS configurations. |
| Queue-weighted example | | |
| Switch(config)# qos queue-weighted 1:2:4:6:8:10:12:14 | | Specify the queue weights as 1:2:4:6:8:10:12:14. |

2.5.14 SNMP Server Command

1. Create a SNMP community and set up detailed configurations for this community.

| Snmp-server command | Parameter | Description |
|--|-------------------|--|
| Switch(config)# snmp-server community [community] | [community] | Specify a SNMP community name up to 20 alphanumeric characters. |
| Switch(config-community-NAME)# active | | Enable this SNMP community account. |
| Switch(config-community-NAME)# description [Description] | [Description] | Enter the description up to 35 alphanumeric characters for this SNMP community. |
| Switch(config-community-NAME)# level [admin rw ro] | [admin rw ro] | Specify the access privilege for this SNMP account. By default, when you create a community, the access privilege for this account is set to "read only". Admin: Full access right, including maintaining user account, system |

| | | |
|---|-------------|--|
| | | information, loading factory settings, etc.. rw: Read & Write access privilege. Partial access right, unable to modify system information, user account, load factory settings and upgrade firmware. Ro: Read Only access privilege. |
| No command | | |
| Switch(config)# no snmp-server community [community] | [community] | Delete the specified community. |
| Switch(config-community-NAME)# no active | | Disable this SNMP community account. |
| Switch(config-community-NAME)# no description | | Remove the entered SNMP community descriptions. |
| Switch(config-community-NAME)# no level | | Remove the configured level. This will set this community's level to read only. |
| Show command | | |
| Switch(config)# show snmp-server community [community] | [community] | Show the specified SNMP server account's settings. |
| Switch(config)# show snmp-server community | | Show SNMP community account's information in Global Configuration Mode. |
| Switch(config-community-NAME)# show | | View or verify the configured SNMP community account's information. |
| Exit command | | |
| Switch(config-community-NAME)# exit | | Return to Global Configuration Mode. |
| Snmp-server example | | |
| Switch(config)# snmp-server community mycomm | | Create a new community "mycomm" and edit the details of this community account. |
| Switch(config-community-mycomm)# active | | Activate the SNMP community "mycomm". |
| Switch(config-community-mycomm)# description rddeptcomm | | Add a description for "mycomm" community. |
| Switch(config-community-mycomm)# level admin | | Set "mycomm" community level to admin. |

2. Set up a SNMP trap destination.

| Trap-dest command | Parameter | Description |
|--|-------------|--|
| Switch(config)# snmp-server trap-destination [1-3] | [1-3] | Create a trap destination account. |
| Switch(config-trap-ACCOUNT)# active | | Enable this SNMP trap destination account. |
| Switch(config-trap-ACCOUNT)# community [community] | [community] | Enter the community name of network management system. |

| | | |
|---|-----------|--|
| Switch(config-trap-ACCOUNT)# destination [A.B.C.D] | [A.B.C.D] | Enter the SNMP server IP address. |
| No command | | |
| Switch(config)# no snmp-server trap-destination [1-3] | [1-3] | Delete the specified trap destination account. |
| Switch(config-trap-ACCOUNT)# no active | | Disable this SNMP trap destination account. |
| Switch(config-trap-ACCOUNT)# no community | | Delete the configured community name. |
| Switch(config-trap-ACCOUNT)# no description | | Delete the configured trap destination description. |
| Show command | | |
| Switch(config)# show snmp-server trap-destination [1-3] | [1-3] | Show the specified trap destination information. |
| Switch(config)# show snmp-server trap-destination | | Show SNMP trap destination information in Global Configuration mode. |
| Switch(config-trap-ACCOUNT)# show | | View this trap destination account's information. |
| Exit command | | |
| Switch(config- trap-ACCOUNT)# exit | | Return to Global Configuration Mode. |
| Trap-destination example | | |
| Switch(config)# snmp-server trap-destination 1 | | Create a trap destination account. |
| Switch(config-trap-1)# active | | Activate the trap destination account. |
| Switch(config-trap-1)# community mycomm | | Refer this trap destination account to the community "mycomm". |
| Switch(config-trap-1)# description redepttrapdest | | Add a description for this trap destination account. |
| Switch(config-trap-1)# destination 172.168.1.254 | | Set trap destination IP address to 192.168.1.254. |

3. Set up SNMP trap types that will be sent.

| Trap-type command | Parameter | Description |
|---|---|---|
| Switch(config)# snmp-server trap-type [all auth-fail cold-start port-link power-down warm-start] | [all auth-fail cold-start port-link power-down warm-start] | <p>Specify the trap type that will be sent when a certain situation occurs.</p> <p>all: A trap will be sent when authentication fails, the device cold /warm starts, port link is up or down, power is down.</p> <p>auth-fail: A trap will be sent when any unauthorized user attempts to login.</p> <p>cold-start: A trap will be sent when the device boots up.</p> <p>port-link: A trap will be sent when the link is up or down.</p> <p>power-down: A trap will be sent when the device's power is down.</p> <p>warm-start: A trap will be sent when the device restarts.</p> |
| No command | | |
| Switch(config)# no snmp-server trap-type auth-fail | | Authentication failure trap will not be sent. |
| Show command | | |
| Switch(config)# show snmp-server trap-type | | Show the current enable/disable status of each type of trap. |
| Trap-type example | | |
| Switch(config)# snmp-server trap-type all | | All types of SNMP traps will be sent. |

2.5.15 Spanning Tree Command

The Spanning Tree Protocol (STP), defined in the IEEE Standard 802.1D, creates a spanning tree within a mesh network of connected layer-2 bridges (typically Ethernet switches) and disables the links which are not part of that tree, leaving a single active path between any two network nodes.

Multiple active paths between network nodes cause a bridge loop. Bridge loops create several problems. First, the MAC address table used by the switch or bridge can fail, since the same MAC addresses (and hence the same network hosts) are seen on multiple ports. Second, a broadcast storm occurs. This is caused by broadcast packets being forwarded in an endless loop between switches. A broadcast storm can consume all available CPU resources and bandwidth.

Spanning tree allows a network design to include spare (redundant) links to provide automatic backup paths if an active link fails, without the danger of bridge loops, or the need for manually enabling/disabling these backup links.

To provide faster spanning tree convergence after a topology change, an evolution of the Spanning Tree Protocol: Rapid Spanning Tree Protocol (RSTP), introduced by IEEE with document 802.1w. RSTP is a refinement of STP; therefore, it shares most of its basic operation characteristics. This essentially creates a cascading effect away from the root bridge where each designated bridge proposes to its neighbors to determine if it can make a rapid transition. This is one of the major elements which allow RSTP to achieve faster convergence times than STP.

| Spanning-tree command | Parameter | Description |
|---|-------------------------------------|---|
| Switch(config)# spanning-tree aggregated-port | | Enable Spanning Tree Protocol function on aggregated ports. |
| Switch(config)# spanning-tree aggregated-port cost [0-2000000000] | [0-2000000000] | Specify aggregated ports' path cost. The default value is "1". |
| Switch(config)# spanning-tree aggregated-port priority [0-15] | [0-15] | Specify aggregated ports' priority. The default setting is "1". 0=0, 1=16, 2=32, 3=48, 4=64, 5=80 6=96, 7=112, 8=128, 9=144, 10=160 11=176, 12=192, 13=208, 14=224, 15=240 |
| Switch(config)# spanning-tree aggregated-port edge | | Enable aggregated ports to shift to forwarding state when the link is up. If you know a port is directly connected to an end device (that doesn't support RSTP) then set it as an edge port to ensure maximum performance. This will tell the switch to immediately start forwarding traffic on the port and not bother trying to establish a RSTP connection. Otherwise, turn it off. |
| Switch(config)# spanning-tree aggregated-port p2p [forced_true forced_false auto] | [forced_true forced_false auto] | Set the aggregated ports to non-point to point ports (forced_false) or allow the Managed Switch to detect point to point status automatically (auto). By default, aggregated ports are set to point to point ports (forced_true). |
| Switch(config)# spanning-tree delay-time [4-30] | [4-30] | Specify the Forward Delay value in seconds. The allowable value is between 4 and 30 seconds. The default value is "4" seconds. |
| Switch(config)# spanning-tree hello-time [1-10] | [1-10] | Specify the Hello Time value in seconds. The allowable value is between 4 and 30 seconds. The default value is "1" second. |

| | | |
|---|-----------------------|--|
| Switch(config)# spanning-tree max-age [6-200] | [6-200] | Specify the Maximum Age value in seconds. The allowable value is between 6 and 200. The default value is “6” seconds. |
| Switch(config)# spanning-tree priority [0-15] | [0-15] | Specify a priority value on a per switch basis. The allowable value is between 0 and 15. The default value is “1”. 0=0, 1=4096, 2=8192, 3=12288, 4=16384 5=20480, 6=24576, 7=28672, 8=32768 9=36864, 10=40960, 11=45056, 12=49152 13=53248, 14=57344, 15=61440 |
| Switch(config)# spanning-tree version [compatible normal] | [compatible normal] | Set up RSTP version. “ compatible ” means that the Managed Switch is compatible with STP. “ normal ” means that the Managed Switch uses RSTP. |
| No command | | |
| Switch(config)# no spanning-tree aggregated-port | | Disable STP on aggregated ports. |
| Switch(config)# no spanning-tree aggregated-port cost | | Reset aggregated ports’ cost to the factory default. |
| Switch(config)# no spanning-tree aggregated-port priority | | Reset aggregated ports’ priority to the factory default. |
| Switch(config)# no spanning-tree aggregated-port edge | | Disable aggregated ports’ edge ports status. |
| Switch(config)# no spanning-tree aggregated-port p2p | | Reset aggregated ports to point to point ports (forced_true). |
| Switch(config)# no spanning-tree delay-time | | Reset the Forward Delay time back to the factory default. |
| Switch(config)# no spanning-tree hello-time | | Reset the Hello Time back to the factory default. |
| Switch(config)# no spanning-tree max-age | | Reset the Maximum Age back to the factory default. |
| Show command | | |
| Switch(config)# show spanning-tree | | Show or verify STP settings on the per switch basis. |
| Switch(config)# show spanning-tree aggregated-port | | Show or verify STP settings on aggregated ports. |
| Switch(config)# show spanning-tree interface | | Show each interface’s STP information including port state, path cost, priority, edge port state, and p2p port state. |
| Switch(config)# show spanning-tree interface | [port_list] | Show the selected interfaces’ STP information including port state, path |

| [port_list] | | cost, priority, edge port state, and p2p port state. |
|--|--------------------|---|
| Switch(config)# show spanning-tree statistics | | Show each interface and each link aggregation group's statistics information including the total RSTP packets received, RSTP packets transmitted, STP packets received, STP packets transmitted, TCN (Topology Change Notification) packets received, TCN packets transmitted, illegal packets received, and unknown packets received. |
| Switch(config)# show spanning-tree statistics [port_list llag] | [port_list llag] | Show the selected interfaces or link aggregation groups' statistics information including the total RSTP packets received, RSTP packets transmitted, STP packets received, STP packets transmitted, TCN (Topology Change Notification) packets received, TCN packets transmitted, illegal packets received, and unknown packets received. |
| Switch(config)# show spanning-tree status | | Show current RSTP port status. |
| Switch(config)# show spanning-tree status [port_list llag] | [port_list llag] | Show the selected interfaces or link aggregation groups' statistics information |
| Switch(config)# show spanning-tree overview | | Show the current STP state. |
| Spanning-tree command example | | Description |
| Switch(config)# spanning-tree aggregated-port | | Enable Spanning Tree on aggregated ports. |
| Switch(config)# spanning-tree aggregated-port cost 100 | | Set the aggregated ports' cost to 100. |
| Switch(config)# spanning-tree aggregated-port priority 0 | | Set the aggregated ports' priority to 0 |
| Switch(config)# spanning-tree aggregated-port edge | | Set the aggregated ports to edge ports. |
| Switch(config)# spanning-tree aggregated-port p2p forced_true | | Set the aggregated ports to P2P ports. |
| Switch(config)# spanning-tree delay-time 20 | | Set the Forward Delay time value to 10 seconds. |
| Switch(config)# spanning-tree hello-time 2 | | Set the Hello Time value to 2 seconds. |
| Switch(config)# spanning-tree max-age 15 | | Set the Maximum Age value to 15 seconds. |

Use “Interface” command to configure a group of ports’ Spanning Tree settings.

| Spanning tree & Interface command | Parameter | Description |
|--|-----------------------|--|
| Switch(config)# interface [port_list] | [port_list] | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For example:1,3 or 2-4 |
| Switch(config-if-PORT-PORT)# spanning-tree | | Enable spanning-tree protocol on the selected interfaces. |
| Switch(config-if-PORT-PORT)# spanning-tree cost [0-2000000000] | [0-2000000000] | Specify cost value on the selected interfaces. The default setting is “0”. |
| Switch(config-if-PORT-PORT)# spanning-tree priority [0-15] | [0-15] | Specify priority value on the selected interfaces. 0=0, 1=16, 2=32, 3=48, 4=64, 5=80, 6=96, 7=112, 8=128, 9=144, 10=160, 11=176, 12=192, 13=208, 14=224, 15=240 |
| Switch(config-if-PORT-PORT)# spanning-tree edge | | Set the selected interfaces to edge ports. |
| Switch(config-if-PORT-PORT)# spanning-tree p2p [forced_fasle auto] | [forced_fasle auto] | Set the aggregated ports to non-point to point ports (forced_false) or allow the Managed Switch to detect point to point status automatically (auto). By default, aggregated ports are set to point to point ports (forced_true). Forced True: indicates a point-to-point (P2P) shared link.P2P ports are similar to edge ports; however, they are restricted in that a P2P port must operate in full duplex. Similar to edge ports, P2P ports transit to a forwarding state rapidly thus benefiting from RSTP. Forced False: the port cannot have P2P status. Auto: allows the port to have P2P status whenever possible and operates as if the P2P status were true. If the port cannot maintain this status, (for example if the port is forced to half-duplex operation) the P2P status changes to operate as if the P2P value were false. The default setting for this parameter is |

| | | |
|--|--------------------|---|
| | | true. |
| No command | | |
| Switch(config-if-PORT-PORT)# no spanning-tree | | Disable spanning-tree protocol on the selected interfaces. |
| Switch(config-if-PORT-PORT)# no spanning-tree cost | | Set the cost value back to the factory default. |
| Switch(config-if-PORT-PORT)# no spanning-tree priority | | Set the priority value back to the factory default. |
| Switch(config-if-PORT-PORT)# no spanning-tree edge | | Set the selected interfaces to non-edge ports. |
| Switch(config-if-PORT-PORT)# no spanning-tree p2p | | Set the selected interface to point to point ports. |
| Show command | | |
| Switch(config)# show spanning-tree | | Show or verify STP settings on the per switch basis. |
| Switch(config)# show spanning-tree aggregated-port | | Show or verify STP settings on aggregated ports. |
| Switch(config)# show spanning-tree interface | | Show each interface's STP information including port state, path cost, priority, edge port state, and p2p port state. |
| Switch(config)# show spanning-tree interface [port_list] | [port_list] | Show the selected interfaces' STP information including port state, path cost, priority, edge port state, and p2p port state. |
| Switch(config)# show spanning-tree statistics | | Show each interface and each link aggregation group's statistics information including the total RSTP packets received, RSTP packets transmitted, STP packets received, STP packets transmitted, TCN (Topology Change Notification) packets received, TCN packets transmitted, illegal packets received, and unknown packets received. |
| Switch(config)# show spanning-tree statistics [port_list llag] | [port_list llag] | Show the selected interfaces or link aggregation groups' statistics information including the total RSTP packets received, RSTP packets transmitted, STP packets received, STP packets transmitted, TCN (Topology Change Notification) packets received, TCN packets transmitted, illegal packets received, and unknown packets received. |
| Switch(config)# show spanning- | | Show current RSTP port status. |

| tree status | | |
|--|--------------------|--|
| Switch(config)# show spanning-tree status [port_list llag] | [port_list llag] | Show the selected interfaces or link aggregation groups' statistics information |
| Switch(config)# show spanning-tree overview | | Show the current STP state. |
| Spanning-tree & interface command example | | Description |
| Switch(config)# interface 1-3 | | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For example:1,3 or 2-4 |
| Switch(config-if-1-3)# spanning-tree cost 100 | | Set the selected interfaces' cost to 100. |
| Switch(config-if-1-3)# spanning-tree priority 0 | | Set the selected interfaces' priority to 0 |
| Switch(config-if-1-3)# spanning-tree edge | | Set the selected ports to edge ports. |
| Switch(config-if-1-3)# spanning-tree p2p forced_false | | Set the selected ports to non-P2P ports. |

2.5.16 Switch Command

| Switch command | Description |
|--|--|
| Switch(config)# switch sfp polling | Enable the Switch to refresh the SFP DMI information and current state in a fixed interval. |
| Switch(config)# switch statistics polling | Enable the Switch to refresh the counter information and current state in a fixed interval. |
| No command | |
| Switch(config)# no switch sfp polling | Disable the Switch to refresh the SFP DMI information and current state in a fixed interval. |
| Switch(config)# no switch statistics polling | Disable the Switch to refresh the counter information and current state in a fixed interval. |

2.5.17 Switch-info Command

To set up the Managed Industrial Switch's basic information including company name, hostname, system name, etc., use "switch-info" command.

| Switch-info Command | Parameter | Description |
|---|----------------|--|
| Switch(config)# switch-info company-name [company_name] | [company_name] | Enter a company name up to 55 alphanumeric characters for this Switch. |

| | | |
|--|-------------------|---|
| Switch(config)# switch-info dhcp-vendor-id [dhcp_vendor_id] | [dhcp_vendor_id] | Enter the user-defined DHCP vendor ID up to 55 alphanumeric characters. Please make sure you have an exact DHCP Vendor ID with the value specified in “vendor-classes” in your dhcp.conf file. For detailed information, please see Appendix A . |
| Switch(config)# switch-info system-contact [system_contact] | [system_contact] | Enter the contact information up to 55 alphanumeric characters for this Managed Industrial Switch. |
| Switch(config)# switch-info system-location [system_location] | [system_location] | Enter a brief description of the Managed Industrial Switch location up to 55 alphanumeric characters. The location is for reference only, for example, “13 th Floor”. |
| Switch(config)# switch-info system-name [system_name] | [system_name] | Enter a unique name up to 55 alphanumeric characters for this Managed Industrial Switch. Use a descriptive name to identify the Managed Industrial Switch in relation to your network, for example, “Backbone 1”. This name is mainly used for reference only. |
| Switch(config)# switch-info host-name [host_name] | [host_name] | Enter a new hostname up to 15 alphanumeric characters for this Managed Industrial Switch. By default, the hostname prompt shows the model name of this Managed Industrial Switch. You can change the factory-assigned hostname prompt to the one that is easy for you to identify within the network configuration and maintenance. |
| No command | | |
| Switch(config)# no switch-info company-name | | Set the company name to the factory default. |
| Switch(config)# no switch-info dhcp-vendor-id | | Set the DHCP vendor ID to the factory default. |
| Switch(config)# no switch-info system-contact | | Set the system contact information to the factory default. |
| Switch(config)# no switch-info system-location | | Set the system location to the factory default. |
| Switch(config)# no switch-info system-name | | Set the system name to the factory default. |
| Switch(config)# no switch-info host-name | | Set the hostname to the factory default. |
| Show command | | |
| Switch(config)# show switch-info | | Show the switch information including company name, system contact, system location, system name, model name, firmware version, fiber type, etc. |
| Switch-info example | | |

| | |
|---|---|
| Switch(config)# switch-info company-name telecomxyz | Set the company name to “telecomxyz”. |
| Switch(config)# switch-info system-contact info@company.com | Set the system contact information to “info@compnay.com”. |
| Switch(config)# switch-info system-location 13thfloor | Set the system location to “13thfloor”. |
| Switch(config)# switch-info system-name backbone1 | Set the system name to “backbone1”. |

2.5.18 Ring Detection Command

Ring Detection used in ring topology is a helpful way of network recovery, preventing from disconnection resulting from any unexpected link down.

| Ring Detection command | Parameter | Description |
|---|-------------|---|
| Switch(config)# ring-detection | | Enable ring detection. |
| Switch(config)# ring-detection role [master] | [master] | Assign Ring role as master. |
| Switch(config)# ring-detection port [port_list] | [port_list] | Specify Ring port. |
| No command | | |
| Switch(config)# no ring-detection role | | Undo the Ring role. |
| Switch(config)# no ring-detection port | | Disable Ring Detection on ports specified. |
| Show command | | |
| Switch(config)#show ring-detection | | Show Ring Detection information and Ring Detection configuration. |
| Switch(config)#show ring-detection state | | Show Ring Detection status. |

2.5.19 Syslog Command

| Syslog command | Parameter | Description |
|--|-----------|---|
| Switch(config)# syslog | | Enable the syslog server. |
| Switch(config)# syslog server1/server2/server3 [A.B.C.D] | [A.B.C.D] | Configure the IP address of the syslog server1/server2/server3. |
| No command | | |
| Switch(config)# no syslog | | Disable the syslog server. |
| Show command | | |
| Switch(config)#show syslog | | Show the syslog information. |
| Syslog example | | |

| | |
|--|--|
| Switch(config)# syslog Switch(config)# syslog server1 192.168.0.222 | Enable syslog and assign the server1 IP address 192.168.0.222. |
|--|--|

2.5.20 Time Range Command

This command defines a time interval to be activated on a daily or weekly basis. This is convenient to assign when a function should automatically take effect. Before using the function, make sure that gateway is set under either IPv4 mode in **IP Command** (Section 2.5.6) and time server is configured in **NTP Command** (Section 2.5.10). Time Range related function scheduling will only take effect when Switch system time is sync with NTP time server.

| Command | Parameter | Description |
|--|---------------------------|--|
| Switch(config –time-range-name)# absolute start [hh:mm dd MMM yyyy] | [hh:mm dd MMM yyyy] | Specify an absolute start time to a time interval. Where: hh(hour)→0-23 mm(minute)→0-59 dd(date)→1-31 MMM(month)→jan,feb,mar,apr,may,jun,jul,aug,sep,oct,nov,dec yyyy(year)→2000-2097 No start time assigned refers to start immediately. One absolute start point can be set at most. |
| Switch(config –time-range-name)# absolute end [hh:mm dd MMM yyyy] | [hh:mm dd MMM yyyy] | Specify an absolute end time to a time interval. Where: hh(hour)→0-23 mm(minute)→0-59 dd(date)→1-31 MMM(month)→jan,feb,mar,apr,may,jun,jul,aug,sep,oct,nov,dec yyyy(year)→2000-2097 No end time assigned refers to run an function continuously. One absolute end point can be set at most. |
| Switch(config –time-range-name)# periodic [hh:mm dd] to [hh:mm dd] | [hh:mm dd] to [hh:mm dd] | Specify weekly recurring time interval. Two set of periodic intervals can be set at most. |
| Switch(config –time-range-name)# periodic list [hh:mm] to [hh:mm] [days] | [hh:mm] to [hh:mm] [days] | Specify a list of days in a week for periodic run. Where: hh(hour)→0-23 mm(minute)→0-59 |

| | | |
|---|---|---|
| | | days(7 days)→ including Sunday(sun), Monday(mon), Tuesday(tue), Wednesday(wed), Thursday(thu), Friday(fri), Saturday(sat) Cross-day setting is feasible. In other words, the second occurrence of time can be set on the following day, e.g. “22:00-2:00”. Two set of periodic list intervals can be set at most. |
| No Command | | |
| Switch(config)# no time-range [time_range_name] | Remove a specified time-range name. | |
| Switch(config –time-range-name)# no absolute start | Remove absolute start time. Under a time range name, user may add one absolute start time and one absolute end time at most. Users may also add two optional time ranges at most using Periodic and Periodic List time range. For example, Users may set: 1. Two Periodic in time range, or 2. One Periodic and one Periodic List in time range, or 3. Two Periodic List in time range. | |
| Switch(config –time-range-name)# no absolute end | Remove absolute start time. Under a time range name, user may add one absolute start time and one absolute end time at most. Users may also add two optional time ranges at most using Periodic and Periodic List time range. For example, Users may set: 1. Two Periodic in time range, or 2. One Periodic and one Periodic List in time range, or 3. Two Periodic List in time range. | |
| Switch(config –time-range-name)# no periodic [hh:mm] [day] [hh:mm] [day] | Remove periodic weekly time interval. (sun, mon, tue, wed, thu, fri, sat) | |
| Switch(config –time-range-name)# no periodic list [hh:mm] to [hh:mm] [days] | Remove periodic list interval. | |
| Show Command | | |
| Switch(config)# show time-range | Display the time-range configuration | |
| Switch(config)# show time-range [time_range_name] | Display the specified time-range configuration | |
| Example Command | | |
| Switch(config –time-range-name)# absolute start 8:00 10 | Set effective time range start from 8:00, January 10 th , 2015 sharp. | |

| | |
|---|--|
| jan 2015 | |
| Switch(config –time-range-name)# absolute end 18:00 10 dec 2015 | Set an effective time range that stops at 18:00, December 10 th , 2015 sharp. |
| Switch(config –time-range-name)# periodic 10:00 mon to 20:00 wed | Set an effective time range that start from 10:00, Monday to 20:00 Wednesday. |
| Switch(config –time-range-name)# periodic list 09:00 to 18:00 mon tue wed thu fri | Set an effective time range that start from 09:00 to 18:00 every weekday. |
| Switch(config –time-range-name)# periodic list 20:00 to 04:00 tue wed thu fri sat | Set an effective time range that start from 20:00, Tuesday to 04:00 Saturday. |
| Switch(config –time-range-name)# periodic list 08:00 to 10:00 wed thu | Set an effective time range that start from 08:00 to 10:00 every Wednesday and Thursday. |

2.5.21 User Command

1. Create a new login account.

| User command | Parameter | Description |
|---|-------------------|---|
| Switch(config)# user name [user_name] | [user_name] | Create a new user account. The authorized user login name is up to 20 alphanumeric characters. The maximum of the user accounts that can be created is 10. |
| Switch(config-user-USERNAME)# active | | Activate this user account. |
| Switch(config-user-USERNAME)# description [description] | [description] | Enter the brief description for this user account. |
| Switch(config-user-USERNAME)# level [admin rw ro] | [admin rw ro] | <p>Specify the user account level. By default, when you create a user account, the access privilege is set to “admin”.</p> <p>admin: Full access right, including maintaining user account, system information, loading factory settings, etc.</p> <p>rw: Read & Write access privilege. Partial access right which is unable to modify system information, user account, load factory settings and upgrade firmware.</p> <p>Ro: Read Only access privilege.</p> |

| | | |
|---|-------------|--|
| Switch(config-user-USERNAME)# password [password] | [password] | Enter the password for this user account up to 20 alphanumeric characters. |
| No command | | |
| Switch(config)# no user name [user_name] | [user_name] | Delete the specified user account. |
| Switch(config-user-USERNAME)# no description | | Remove the configured description. |
| Switch(config-user-USERNAME)# no level | | Remove the configured level. The account level will be set to the default setting. |
| Switch(config-user-USERNAME)# no password | | Remove the configured password. |
| Show command | | |
| Switch(config)# show user name [user_name] | [user_name] | Show the specified account's information. |
| Switch(config)# show user name | | List all user accounts. |
| Switch(config-user-USERNAME)# show | | Show or verify the newly-created user account's information. |
| User command example | | |
| Switch(config)# user name miseric | | Create a new login account "miseric". |
| Switch(config-user-USERNAME)# description misengineer | | Add a description to this new account "miseric". |
| Switch(config-user-USERNAME)# level rw | | Set this new account's access privilege to "read & write". |
| Switch(config-user-USERNAME)# password mis2256i | | Set up a password for this new account "miseric" |

2. Configure RADIUS server settings.

| User command | Parameter | Description |
|--|--------------|--|
| Switch(config)# user radius | | Enable RADIUS authentication. |
| Switch(config)# user radius radius-port [1025-65535] | [1025-65535] | Specify the RADIUS server port number. The default value is "1812" |
| Switch(config)# user radius retry-time [0-2] | [0-2] | Specify the number of times that the Switch will try to reconnect if the RADIUS server is not reachable. The default value is "0". |
| Switch(config)# user radius secret [secret] | [secret] | Specify a secret up to 30 alphanumeric characters for the RADIUS server. This secret key is used to validate the communication between the RADIUS server and Switch. |
| Switch(config)# user radius server1 [A.B.C.D] | [A.B.C.D] | Specify the primary RADIUS server IP address. |
| Switch(config)# user radius server2 [A.B.C.D] | [A.B.C.D] | Specify the secondary RADIUS server IP address. |

| No command | |
|---|--|
| Switch(config)# no user radius | Disable RADIUS authentication. |
| Switch(config)# no user radius radius-port | Set the radius port back to the factory default. |
| Switch(config)# no user radius retry-time | Set the retry time back to the factory default. |
| Switch(config)# no user radius secret | Remove the configured secret. |
| Switch(config)# no user radius server1 | Delete the primary RADIUS server IP address. |
| Switch(config)# no user radius server2 | Delete the secondary RADIUS server IP address. |
| Show command | |
| Switch(config)# show user radius | Show current RADIUS settings. |
| User command example | |
| Switch(config)# user radius | Enable RADIUS authentication. |
| Switch(config)# user radius radius-port 1812 | Set the RADIUS server port number to 1812. |
| Switch(config)# user radius retry-time 2 | Set the retry time to 2. The Switch will try to reconnect twice if the RADIUS server is not reachable. |
| Switch(config)# user radius secret abcxyzabc | Set up a secret abcxyzabc for validating the communication. |
| Switch(config)# user radius server1 192.180.3.1 | Set the primary RADIUS server IP address to 192.180.3.1. |
| Switch(config)# user radius server2 192.180.3.2 | Set the secondary RADIUS server IP address to 192.180.3.2. |

2.5.22 VLAN Command

A Virtual Local Area Network (VLAN) is a network topology configured according to a logical scheme rather than the physical layout. VLAN can be used to combine any collections of LAN segments into a group that appears as a single LAN. VLAN also logically segments the network into different broadcast domains. All broadcast, multicast, and unknown packets entering the Switch on a particular VLAN will only be forwarded to the stations or ports that are members of that VLAN.

VLAN can enhance performance by conserving bandwidth and improve security by limiting traffic to specific domains. A VLAN is a collection of end nodes grouped by logics instead of physical locations. End nodes that frequently communicate with each other are assigned to the same VLAN, no matter where they are physically located on the network. Another benefit of VLAN is that you can change the network topology without physically moving stations or changing cable connections. A station can be 'moved' to another VLAN and thus communicates with its members and shares its resources, simply by changing the port settings from one VLAN to another. This allows VLAN to accommodate network moves, changes and additions with the greatest flexibility.

802.1Q VLAN Concept

Port-Based VLAN is simple to implement and use, but it cannot be deployed cross switches VLAN. The 802.1Q protocol was developed in order to provide the solution to this problem. By tagging VLAN membership information to Ethernet frames, the IEEE 802.1Q can help network administrators break large switched networks into smaller segments so that broadcast and multicast traffic will not occupy too much available bandwidth as well as provide a higher level security between segments of internal networks.

Introduction of 802.1Q frame format

| | | | |
|---------|-----------------------|-------------------|--|
| PRE | Preamble | 62 bits | Used to synchronize traffic |
| SFD | Start Frame Delimiter | 2 bits | Marks the beginning of the header |
| DA | Destination Address | 6 bytes | The MAC address of the destination |
| SA | Source Address | 6 bytes | The MAC address of the source |
| TCI | Tag Control Info | 2 bytes | Set to 0x8100 for 802.1p and Q tags |
| P | Priority | 3 bits | Indicates 802.1p priority level 0-7 |
| C | Canonical Indicator | 1 bit | Indicates if the MAC addresses are in the canonical format – Ethernet is set to “0”. |
| VID | VLAN Identifier | 12 bits | Indicates the VLAN (0-4095) |
| T/L | Type/Length Field | 2 bytes | Ethernet II “type” or 802.3 “length” |
| Payload | | < or = 1500 bytes | User data |
| FCS | Frame Check Sequence | 4 bytes | Cyclical Redundancy Check |

Important VLAN Concepts for 802.1Q VLAN Configuration

There are two key concepts as follows:

- **Access-VLAN** specifies the VLAN ID to the switch port that will assign the VLAN ID to **untagged** traffic from that port. A port can only be assigned to one Access-VLAN at a time. When the port is configured as **Access Mode**, the port is called an **Access Port**, and the link to/from this port is called an **Access Link**. The VLAN ID assigned is called **PVID**.
- **Trunk-VLAN** specifies a set of VLAN IDs to a given port to receive and send **tagged** packets which have the same VLAN ID. A port can be assigned to multiple Trunk-VLANs

at a time. When the port is configured as **Trunk Mode**, the port is called a **Trunk Port**, and the link to/from this port is called a **Trunk Link**. The VLAN ID assigned is called **VID**.

A port can be configured to the 802.1q VLAN modes as below:

- **Access Mode:**

Access Links (the link to/from access ports) are the most common type of links on any VLAN switch. All network hosts (such as PCs) connect to the switch's Access Links in order to gain access to the local network. We configure only one Access-VLAN per port, that is, there's only one VLAN ID (VID) which the network hosts will be allowed to access.

It is important to note at this point that any network host connected to an Access Port is totally unaware of the VLAN assigned to the port. The network host simply assumes it is part of a single broadcast domain, just as it happens with any normal switch. During data transfers, any VLAN information or data from other VLANs is removed so the recipient has no information about them.

- **Trunk Mode:**

Trunk Links (the link to/from trunk ports) is configured to carry packets for multiple VLANs. This type of ports is usually found in connections between switches. These links require the ability to carry packets from multiple VLANs because VLANs span over multiple switches.

- **Trunk Native Mode:**

A Trunk-native port can carry untagged packets and the 802.1Q tagged packets simultaneously. Untagged packets can pass the Trunk-Native port, but the untagged packets will be tagged a value of the assigned Port VLAN ID (PVID) in the internal device. Tagged packets with the value of the assigned VLAN IDs (VIDs) can pass through the interface as well. In addition, these packets will keep their original VLAN ID in the internal device.

Example: PortX configuration

| Configuration | Result |
|---|--|
| Trunk-VLAN = 10, 11, 12 Access-VLAN = 20 Mode = Access | PortX is an Access Port . PortX's VID is ignored. PortX's PVID is 20. PortX sends Untagged packets (PortX takes away VLAN tag if the PVID is 20). PortX receives Untagged packets only. |
| Trunk-VLAN = 10, 11, 12 Access-VLAN = 20 Mode = Trunk | PortX is a Trunk Port . PortX's VID is 10, 11 and 12. PortX's PVID is ignored. PortX sends and receives Tagged packets whose VID is 10, 11 or 12. |
| Trunk-VLAN = 10, 11, 12 Access-VLAN = 20 | PortX is a Trunk-native Port . PortX's VID is 10, 11 and 12. |

| | |
|----------------------------|---|
| Mode = Trunk-native | PortX's PVID is 20. PortX sends and receives Tagged packets whose VID is 10, 11 or 12. PortX receives Untagged packets and add PVID 20 |
|----------------------------|---|

1. To use the “Interface” command to configure a group of ports’ 802.1q VLAN settings:

| VLAN & Interface command | Parameter | Description |
|---|------------------|--|
| Switch(config)# interface [port_list] | [port_list] | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For example: 1,3 or 2-4 |
| Switch(config-if-PORT-PORT)# vlan dot1q-vlan access-vlan [1-4094] | [1-4094] | Specify the selected ports’ Access-VLAN ID (PVID). The default VID is “1”. |
| Switch(config-if-PORT-PORT)# vlan dot1q-vlan trunk-vlan [1-4094] | [1-4094] | Specify the selected ports’ Trunk-VLAN ID (VID). The default VID is “1”. |
| Switch(config-if-PORT-PORT)# vlan dot1q-vlan mode access | | Set the selected ports to Access mode (untagged). |
| Switch(config-if-PORT-PORT)# vlan dot1q-vlan mode trunk | | Set the selected ports to Trunk mode (tagged). |
| Switch(config-if-PORT-PORT)# vlan dot1q-vlan mode trunk native | | Set the selected ports to Trunk-Native mode. (Tagged and untagged) Note: When you assign a default Access-VLAN to the trunk-native port, all untagged traffic travels on the default Access-VLAN for the trunk-native port, and all untagged traffic is assumed to belong to this Access-VLAN. |
| Switch(config-if-PORT-PORT)# vlan port-based [name] | [name] | Set the selected ports to a specified port-based VLAN. Note: Before adding a port to a VLAN group, it’s necessary to create a port-based VLAN group first by the “vlan port-based [name]” command. |
| No command | | |
| Switch(config-if-PORT-PORT)# no vlan dot1q-vlan access-vlan | | Set the selected ports’ PVID to the default setting. |
| Switch(config-if-PORT-PORT)# no vlan dot1q-vlan mode | | Set the VLAN mode of the selected port(s) to Access mode. |
| Switch(config-if-PORT-PORT)# no vlan dot1q-vlan mode trunk native | | Set the VLAN mode of the selected port(s) to Trunk mode. |
| Switch(config-if-PORT-PORT)# no vlan dot1q-vlan trunk-vlan [1-4094] | [1-4094] | Remove the selected port(s) from the specified trunk VLAN group. |

| | | |
|---|--------|---|
| Switch(config-if-PORT-PORT)# no vlan port-based [name] | [name] | Remove the selected port(s) from the specified port-based VLAN group. |
| VLAN & interface command example | | |
| Switch(config)# interface 1-3 | | Enter port 1 to port 3's interface mode. |
| Switch(config-if-1-3)# vlan dot1q-vlan access-vlan 10 | | Set port 1 to port 3's Access-VLAN ID (PVID) to 10. |
| Switch(config-if-1-3)# vlan dot1q-vlan mode access | | Set the selected ports to Access mode (untagged). |
| Switch(config-if-1-3)# vlan dot1q-vlan mode trunk native | | Set the selected ports to Trunk-Native mode (tagged and untagged). |
| Switch(config-if-1-3)# vlan port-based mktpbvlan | | Set the selected ports to the specified port-based VLAN group "mktpbvlan". |

2. To modify a 802.1q VLAN and a management VLAN rule or create a port-based VLAN group:

Port-based VLAN can effectively segment one network into several broadcast domains. Broadcast, multicast and unknown packets will be limited within the VLAN. Port-Based VLAN is uncomplicated, fairly rigid in implementation, and useful for network administrators who want to quickly and easily set up VLAN so as to isolate the effect of broadcast packets on their network.

| VLAN dot1q command | Parameter | Description |
|---|------------------------------------|---|
| Switch(config)# vlan dot1q-vlan | | Enable 802.1q VLAN. |
| Switch(config)# vlan dot1q-vlan [1-4094] | [1-4094] | Modify a specified 802.1q VLAN. Note: A 802.1q VLAN needs to be created under the "interface" command. Here, you can only modify it instead of creating a new VLAN ID. |
| Switch(config-vlan-ID)# name [vlan_name] | [vlan_name] | Specify a descriptive name for this VLAN ID, up to 15 characters. |
| Switch(config)# vlan management-vlan [1-4094] management-port [port_list] mode [access trunk trunk-native] | [1-4094] | Specify the management VLAN ID. |
| | [port_list] | Specify the management port. |
| | [access trunk trunk-native] | Assign the management port to Trunk, Trunk-Native or Access mode. "trunk" mode: The selected ports send and receive tagged packets. "access" mode: The selected ports |

| | | |
|---|-------------|---|
| | | send and receive untagged packets. “trunk-native” mode: The selected ports send and receive tagged and untagged packets |
| Switch(config)# vlan port-based | | Enable port-based VLAN. |
| Switch(config)# vlan port-based [name] | [name] | Specify a name for this port-based VLAN, up to 15 characters. |
| Switch(config)# vlan port-based [name] include-cpu | | Include CPU into this port-based VLAN. |
| No command | | |
| Switch(config)# no vlan dot1q-vlan | | Disable 802.1q VLAN |
| Switch(config-vlan-ID)# no name | | Remove the descriptive name of the specified VLAN ID. |
| Switch(config)# no vlan port-based | | Disable port-based VLAN. |
| Switch(config)# no vlan port-based [name] | [name] | Delete the specified port-based VLAN. |
| Switch(config)# no vlan port-based [name] include-cpu | | Exclude CPU from this port-based VLAN |
| Show command | | |
| Switch(config)# show vlan dot1q-vlan tag-vlan | | Show IEEE 802.1q Tag VLAN table |
| Switch(config)# show vlan dot1q-vlan trunk-vlan | | Show Configure Trunk VLAN table |
| Switch(config-vlan-ID)# show | | Show the membership status of this VLAN ID |
| Switch(config)# show vlan interface | | Show all ports' VLAN assignment and VLAN mode. |
| Switch(config)# show vlan interface [port_list] | [port_list] | Show the selected ports' VLAN assignment and VLAN mode. |
| Switch(config)# show vlan port-based | | Show the port-based VLAN table. |
| Exit command | | |
| Switch(config-vlan-ID)# exit | | Return to Global configuration mode. |
| Port-based VLAN example | | |
| Switch(config)# vlan port-based MKT_Office | | Create a port-based VLAN “MKT_Office”. |
| Switch(config)# vlan management-vlan 1 management-port 1-3 mode access | | Set VLAN 1 to management VLAN (untagged) and port 1~3 to management ports. |

2.5.23 interface command

Use this command to set up various port configurations of discontinuous or a range of ports.

1. To enter interface numbers:

| Command | Parameter | Description |
|--|-------------|---|
| Switch(config)# interface [port_list] | [port_list] | Enter several port numbers separated by commas or a range of port numbers with a hyphen. For example: 1,3 or 2-4 |

Note: You need to enter interface numbers first before issuing 2-9 commands below.

2. To enable the port auto-negotiation:

| Command | Parameter | Description |
|---|-----------|---|
| Switch(config-if-PORT-PORT)# auto-negotiation | | Set the selected interfaces to the auto-negotiation. When the auto-negotiation is enabled, the speed configuration will be ignored. |
| No command | | |
| Switch(config-if-PORT-PORT)# no auto-negotiation | | Set the auto-negotiation setting to the default setting. |

3. To set up port-trunking:

| Command | Parameter | Description |
|--|--------------|---|
| Switch(config-if-PORT-PORT)# channel-group trunking [group_name] | [group_name] | Specify the selected port(s) to the trunking group. Note 1: At least 2 ports, not more than 8 ports can be aggregated. Note 2: A port-trunking group needs to be created before assigning ports to it (see 2.5.4 “channel-group”) |
| No command | | |
| Switch(config-if-PORT-PORT)# channel-group trunking | | Remove the ports from the port-trunking group. |

4. Set up LACP configuration

| Command | Parameter | Description |
|--|-------------|--|
| Switch(config)# interface [port_list] | [port_list] | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For example:1,3 or 2-4 |
| Switch(config-if-PORT-PORT)# channel-group lacp | | Enable LACP on the selected interfaces. |
| Switch(config-if-PORT-PORT)# channel-group lacp key [0-255] | [0-255] | Specify a key to the selected interfaces. |
| Switch(config-if-PORT-PORT)# channel-group lacp type [active] | [active] | Specify the selected interfaces to active LACP role. |
| No command | | |
| Switch(config-if-PORT-PORT)# no channel-group lacp | | Disable LACP on the selected interfaces. |
| Switch(config-if-PORT-PORT)# no channel-group lacp key | | Reset the key value of the selected interfaces to the factory default. |
| Switch(config-if-PORT-PORT)# no channel-group lacp role | | Reset the LACP type of the selected interfaces to the factory default (passive mode). |
| Show command | | |
| Switch(config)# show channel-group lacp | | Show or verify each interface's LACP settings including current mode, key value and LACP type. |
| Switch(config)# show channel-group lacp [port_list] | [port_list] | Show or verify the selected interfaces' LACP settings. |
| Switch(config)# show channel-group lacp status | | Show or verify each interface's current LACP status. |
| Switch(config)# show channel-group lacp status [port_list] | [port_list] | Show or verify the selected interfaces' current LACP status. |
| Switch(config)# show channel-group lacp statistics | | Show or verify each interface's current LACP traffic statistics. |
| Switch(config)# show channel-group lacp statistics [port_list] | [port_list] | Show or verify the selected interfaces' current LACP statistics. |
| Switch(config)# show channel-group lacp statistics clear | | Clear all LACP statistics. |

5. To set up the port description:

| Command | Parameter | Description |
|--|---------------|---|
| Switch(config-if-PORT-PORT)# description [description] | [description] | Type the description of the port(s), up to 35 characters. |
| No command | | |
| Switch(config-if-PORT-PORT)# no description | | Remove the entered description of the selected port(s). |

6. To configure the media type:

| Command | Parameter | Description |
|--|------------------------------------|--|
| Switch(config-if-PORT-PORT)# media-type [fiber copper Auto-Media] | [fiber copper Auto-Media] | Configure the media type of the port(s). Note: Only port 9 and 10 which are combo ports can be configured. |
| No command | | |
| Switch(config-if-PORT-PORT)# no media-type | | Set the media type of the port(s) back to the default which is Auto-Media. |

7. To configure the Dot1x setting:

| Command | Parameter | Description |
|--|-------------|---|
| Switch(config)# interface [port_list] | [port_list] | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For example:1,3 or 2-4 |
| Switch(config-if-PORT-PORT)# dot1x port-control [auto unauthorized] | | Specify the selected ports to “auto” or “unauthorized”. “auto”: This requires 802.1X-aware clients to be authorized by the authentication server. Accesses from clients that are not dot1x aware will be denied. “unauthorized”: This forces the Managed Switch to deny access to all clients, neither 802.1X-aware nor 802.1X-unaware. |
| Switch(config-if-PORT-PORT)# dot1x reauthenticate | | Re-authenticate the selected interfaces. |
| No command | | |
| Switch(config)# interface [port_list] | [port_list] | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For example:1,3 or 2-4 |
| Switch(config-if-PORT-PORT)# no dot1x port-control | | Reset the selected interfaces’ 802.1x state to the factory default (authorized state). |
| Show command | | |
| Switch(config)# show dot1x | | Show or verify 802.1x settings. |
| Switch(config)# show dot1x interface | | Show or verify each interface’s 802.1x settings including port status and authentication status. |
| Switch(config)# show dot1x interface [port_list] | [port_list] | Show or verify the selected interfaces’ 802.1x settings including port status |

| | | |
|---|-------------|--|
| | | and authentication status. |
| Switch(config)# show dot1x statistics | | Show or verify 802.1x statistics. |
| Switch(config)# show dot1x statistics [port_list] | [port_list] | Show or verify the selected interfaces' statistics. |
| Switch(config)# show dot1x status | | Show or verify 802.1x status. |
| Switch(config)# show dot1x status [port_list] | [port_list] | Show or verify the selected interfaces' 802.1x status. |
| Command example | | |
| Switch(config)# interface 1-3 | | Enter several discontinuous port numbers separated by commas or a range of ports with a hyphen. For example:1,3 or 2-4 |
| Switch(config-if-1-3)# dot1x port-control auto | | Set the selected ports to "auto" state. |
| Switch(config-if-1-3)# dot1x reauthenticate | | Re-authenticate the selected interfaces immediately. |

8. To set up LLDP:

| Command | Parameter | Description |
|--------------------------------------|-----------|------------------------|
| Switch(config-if-PORT-PORT)# lldp | | Enable LLDP function. |
| No command | | |
| Switch(config-if-PORT-PORT)# no lldp | | Disable LLDP function. |

9. To set up loop detection:

| Command | Parameter | Description |
|--|-----------|------------------------------------|
| Switch(config-if-PORT-PORT)# loop-detection | | Enable loop detection on port(s). |
| No command | | |
| Switch(config-if-PORT-PORT)# no loop-detection | | Disable loop detection on port(s). |

10.To configure the QoS user priority:

| Command | Parameter | Description |
|---------|-----------|-------------|
|---------|-----------|-------------|

| | | |
|---|-------|---|
| Switch(config-if-PORT-PORT)# qos user-priority [0-7] | [0-7] | Specify a 802.1p bit between 0 and 7 to the selected port(s). |
| No command | | |
| Switch(config-if-PORT-PORT)# no qos user-priority | | Set the ports' 802.1p bit back to the default. |

11.To shutdown the selected interface:

| Command | Parameter | Description |
|---|-----------|--|
| Switch(config-if-PORT-PORT)# shutdown | | Administratively disable the selected port(s). |
| No command | | |
| Switch(config-if-PORT-PORT)# no shutdown | | Administratively enable the selected port(s). |

12.To configure the speed operation:

| Command | Parameter | Description |
|---|-------------------|--|
| Switch(config-if-PORT-PORT)# speed [1000 100 10] | [1000 100 10] | Set up the selected interfaces' speed. The speed configuration only works when the interfaces are not under the auto-negotiation mode. |
| No command | | |
| Switch(config-if-PORT-PORT)# no speed | | Set the selected interfaces' speed to the default setting. |

13.To set the VLAN configuration:

| Command | Parameter | Description |
|--|-----------|---|
| Switch(config-if-PORT-PORT)# vlan dot1q-vlan access-vlan [1-4094] | [1-4094] | Configure the ports' PVID. The default VID is "1". |
| Switch(config-if-PORT-PORT)# vlan dot1q-vlan mode access | | Set the selected port(s) to Access mode. |
| Switch(config-if-PORT-PORT)# vlan dot1q-vlan mode trunk | | Set the selected port(s) to Trunk mode. |
| Switch(config-if-PORT-PORT)# vlan dot1q-vlan mode trunk native | | Set the selected port(s) to Trunk-Native mode. |
| Switch(config-if-PORT-PORT)# vlan dot1q-vlan trunk-vlan [1-4094] | [1-4094] | Configure the ports' VID. The default VID is "1". |
| Switch(config-if-PORT-PORT)# vlan port-based [name] | [name] | Add the port(s) to the specific port-based VLAN group. Note: Before adding a port to a VLAN group, it's necessary to create a port- |

| | | |
|---|----------|---|
| | | based VLAN group first by the “vlan port-based [name]” command. |
| No command | | |
| Switch(config-if-PORT-PORT)# no vlan dot1q-vlan access-vlan | | Set the selected ports' PVID to the default setting. |
| Switch(config-if-PORT-PORT)# no vlan dot1q-vlan mode | | Set the VLAN mode of the selected port(s) to Access mode. |
| Switch(config-if-PORT-PORT)# no vlan dot1q-vlan mode trunk native | | Set the VLAN mode of the selected port(s) to Trunk mode. |
| Switch(config-if-PORT-PORT)# no vlan dot1q-vlan trunk-vlan [1-4094] | [1-4094] | Remove the selected port(s) from the specified trunk VLAN group. |
| Switch(config-if-PORT-PORT)# no vlan port-based [name] | [name] | Remove the selected port(s) from the specified port-based VLAN group. |

| | | |
|---|-------------|---|
| Show command | | |
| Switch(config)# show interface status | | Show each interface's status including media type, forwarding state, speed, duplex mode, flow control and link up/down status. |
| Switch(config)# show interface status [port_list] | [port_list] | Show the selected ports' status including media type, forwarding state, speed, duplex mode, flow control and link up/down status. |
| Interface command example | | |
| Switch(config)# interface 1-3 | | Configure the port 1, 2 and 3. |
| Switch(config-if-1-3)# auto-negotiation | | Set the port 1, 2, and 3 to auto-negotiation. |
| Switch(config-if-1-3)# speed 100 | | Set the port 1, 2, and 3 speed to 100Mbps. |
| Switch(config-if-1-3)# shutdown | | Administratively disable the port 1, 2, and 3. |

14.To set RSTP configuration

| Command | Parameter | Description |
|--|----------------|--|
| Switch(config-if-PORT-PORT)# spanning-tree | | Enable spanning-tree protocol. |
| Switch(config-if-PORT-PORT)# spanning-tree cost [0-2000000000] | [0-2000000000] | Specify ports' path cost. The default value is “0”. |
| Switch(config-if-PORT-PORT)# spanning-tree priority [0-15] | [0-15] | Specify bridge priority. 0=0, 1=16, 2=32, 3=48, 4=64, 5=80, 6=96, 7=112, 8=128, 9=144, 10=160, 11=176, 12=192, 13=208, |

| | | |
|--|---------------------------------|--|
| | | 14=224, 15=240 |
| Switch(config-if-POR-PORT)# spanning-tree edge | | Enable ports to shift to forwarding state when the link is up. |
| Switch(config-if-POR-PORT)# spanning-tree p2p [forced_true forced_false auto] | [forced_true forced_false auto] | Specify the interface as the port for point to point. Three types are available: forced_true, forced_false and auto. |
| No command | | |
| Switch(config-if-POR-PORT)# no spanning-tree | | Disable spanning-tree |
| Switch(config-if-POR-PORT)# no spanning-tree cost | | Clear the cost of ports specified. |
| Switch(config-if-POR-PORT)# no spanning-tree priority | | Cancel the priority specified. |
| Switch(config-if-POR-PORT)# no spanning-tree edge | | Disable ports to shift to forwarding state when the link is up. |
| Switch(config-if-POR-PORT)# no spanning-tree p2p | | Disable the type of ports specified. |

15.To set up static MAC address table

| Command | Parameter | Description |
|--|----------------------|---------------------------------|
| Switch(config-if-POR-PORT)# mac address-table static-mac [xx:xx:xx:xx:xx:xx] vlan [1-4094] | [xx:xx:xx:xx:xx:xx:] | Specify a static MAC address |
| | [1-4094] | Specify VLAN ID |
| No command | | |
| Switch(config-if-POR-PORT)# no mac address-table static-mac [xx:xx:xx:xx:xx:xx] vlan [1-4094] | [xx:xx:xx:xx:xx:xx:] | Delete static MAC address entry |
| | [1-4094] | |

2.5.24 show interface statistics command

The command “show interface statistics” that displays port traffic statistics, port packet error statistics and port analysis history can be used either in Privileged mode # and Global Configuration mode (config)#. The “show interface statistics” command is useful for network administrators to diagnose and analyze the port traffic real-time conditions.

| Command | Parameter | Description |
|---|-------------|--|
| Switch(config)# show interface statistics analysis | | Display the accumulated packets analysis for each port. |
| Switch(config)# show interface statistics analysis [port_list] | [port_list] | Display the accumulated packets analysis of the selected ports. |
| Switch(config)# show interface statistics analysis rate | | Display the real-time packets analysis for each port. |
| Switch(config)# show interface statistics analysis rate [port_list] | [port_list] | Display the real-time packets analysis of the selected ports. |
| Switch(config)# show interface statistics error | | Display the accumulated error packets statistics for each port. |
| Switch(config)# show interface statistics error [port_list] | [port_list] | Display the accumulated error packets statistics for the selected ports. |
| Switch(config)# show interface statistics error rate | | Display the real-time error packets statistics for each port. |
| Switch(config)# show interface statistics error rate [port_list] | [port_list] | Display the real-time error packets statistics for the selected ports. |
| Switch(config)# show interface statistics traffic | | Display the accumulate traffic statistics for each port. |
| Switch(config)# show interface statistics traffic [port_list] | [port_list] | Display the accumulated traffic statistics for the selected ports. |
| Switch(config)# show interface statistics traffic rate | | Display the real-time traffic statistics for each port. |
| Switch(config)# show interface statistics traffic rate [port_list] | [port_list] | Display the real-time traffic statistics for the selected ports. |
| Switch(config)# show interface statistics clear | | Clear all statistics counters. |

2.5.25 show sfp command

When you slide in SFP transceivers, the detailed information about this module can be viewed by using this command.

| Command | Description |
|--------------------------------------|--|
| Switch(config)# show sfp information | Display the slide-in SFP information including speed, distance, vendor name, vendor PN and vendor serial number. |
| Switch(config)# show sfp state | Display the slide-in SFP information including temperature, voltage, TX bias, TX power, and RX power. |

2.5.26 show log command

| Command | Description |
|--------------------------|---|
| Switch(config)# show log | Show the event logs currently stored in the Managed Industrial Switch. The total number of event logs that can be displayed is 500. |

2.5.27 show default-config, running-config and start-up-config command

| Command | Description |
|--------------------------------------|---|
| Switch(config)# show default-config | Display the original configurations assigned to the Managed Industrial Switch by the factory. |
| Switch(config)# show running-config | Display the configurations currently used in the Managed Industrial Switch. Please note that you must save running configurations into your switch flash before rebooting or restarting the device. |
| Switch(config)# show start-up-config | Display the system configurations that are stored in flash. |

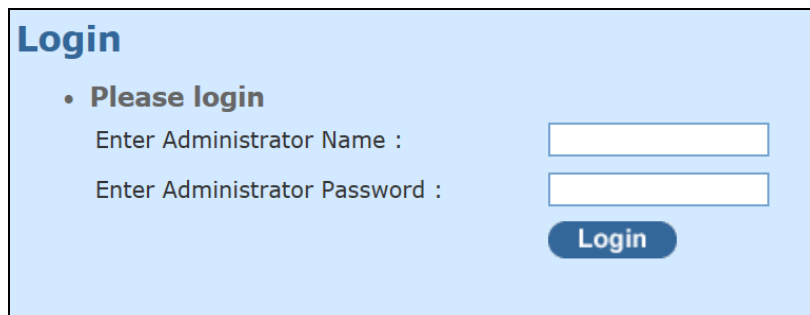

3. WEB MANAGEMENT

The Managed Industrial Switch can be managed via a Web browser. The default IP of the Managed Industrial Switch is “**http://192.168.0.1**”. You can change the Switch’s IP address to the needed one later in its **Network Management** menu.

Follow these steps to manage the Managed Industrial Switch through a Web browser:

1. Use the RS-232 RJ-45 console port or one of the 10/100/1000Base-T RJ-45 ports (as the temporary RJ-45 Management console port) to login the Managed Industrial Switch and set up the assigned IP parameters including the following:
 - IP address
 - Subnet Mask
 - Default Gateway IP address, if required
2. Run a Web browser and specify the Managed Industrial Switch’s IP address to reach it. (The Managed Industrial Switch can be reached at “**http://192.168.0.1**” before any change.)
3. Login to the Managed Industrial Switch.

Once you gain the access, you are requested to login.

The login form is titled "Login" in blue. Below the title, there is a bullet point that says "Please login". There are two input fields: "Enter Administrator Name :" and "Enter Administrator Password :". To the right of the password field is a blue "Login" button.

Enter the administrator name and password for the initial login and then click “Login”. The default administrator name is **admin** and without a password (leave the password field blank).

After a successful login, the screen page is shown as below:

IPS-3110

- System Information
- User Authentication
- Network Management
- Switch Management
- Switch Monitor
- System Utility
- Save Configuration
- Reset System
- Logout

Company Name: Enter a company name up to 55 alphanumeric characters for this Managed Industrial Switch.

System Object ID: View-only field that shows the predefined System OID

System Contact: Enter contact information up to 55 alphanumeric characters for this Managed Industrial Switch.

System Name: Enter a unique name up to 55 alphanumeric characters for this Managed Industrial Switch. Use a descriptive name to identify the Managed Industrial Switch in relation to your network, for example, "Backbone 1". This name is mainly used for reference.

System Location: Enter a brief description of the Managed Industrial Switch location up to 55 alphanumeric characters. The location shown is for reference only.

DHCP Vendor ID: Enter the user-defined vendor ID up to 55 alphanumeric characters. Please make sure you have an exact DHCP Vendor ID with the value specified in "vendor-classes" in your dhcp.conf file. For detailed information, see [Appendix A](#).

Model Name: View-only field that shows the product's model name

Host Name: View-only field that shows the product's host name

Current Boot Image: View-only field that shows the image in use

Configured Boot Image: View-only field that shows the image which would be used after rebooting

Image-1 Version: View-only field that shows the firmware version of the first image

Image-2 Version: View-only field that shows the firmware version of the second image

1000M Port Number: The number of ports transmitting at the speed of 1000Mbps

100M Port Number: The number of ports transmitting at the speed of 100Mbps

M/B Version: View-only field that shows the main board version

Fiber 1 Type: View-only field that shows the information about the slide-in fiber type

Fiber 1 Vendor: View-only field that shows the vendor of the slide-in fiber

Fiber 1 PN: View-only field that shows the PN of the slide-in fiber

Fiber 2 Type*: View-only field that shows information about the slide-in fiber type

Fiber 2 Vendor*: View-only field that shows the vendor of the slide-in fiber

Fiber 2 PN*: View-only field that shows the PN of the slide-in fiber

Serial Number: View-only field that shows the serial number of this switch

Date Code: View-only field that shows the Managed Industrial Switch firmware date code

Up time: View-only field that shows how long the device has been powered on

Local Time: View-only field that shows the time of the location where the switch is

CPU Temperature: View-only field that shows the current temperature of the CPU

SWITCH Temperature: View-only field that shows the current temperature of the switch

POWER Temperature: View-only field that shows the current temperature of the power in use

Power 1: View-only field that shows the status of Power 1

Power 2: View-only field that shows the status of Power 2

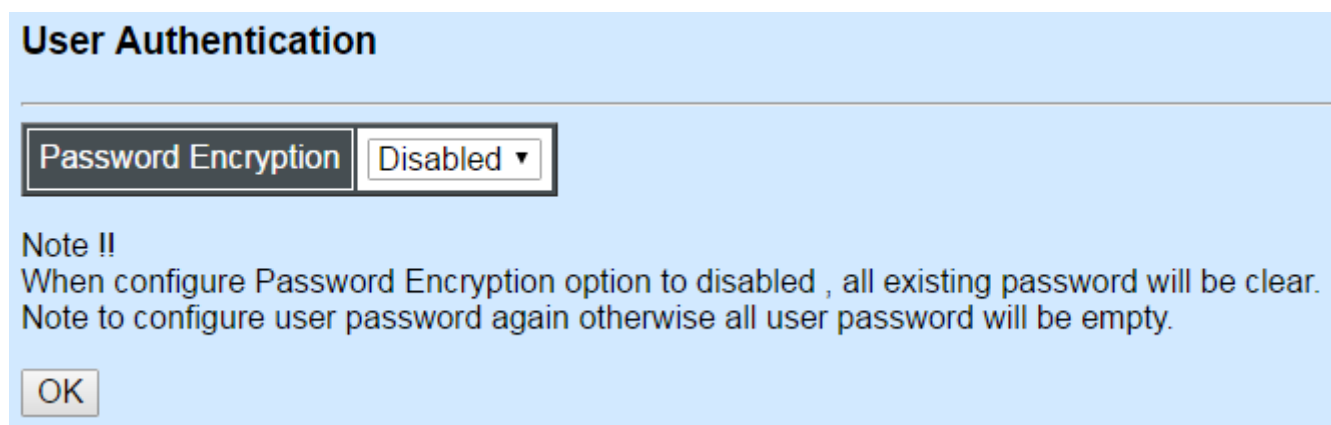

Click the “**OK**” button to apply the modifications.

***Fiber 2 information for 2-fiber model only**

3.2 User Authentication

To prevent any un-authorized access, only registered users are allowed to access the Managed Industrial Switch. Users who want to access the Managed Industrial Switch need to register in the user’s list first.

To view or change current registered users, select **User Authentication** from the left column and then the following screen page shows up.

User Authentication

Password Encryption Disabled ▾

Note !!
When configure Password Encryption option to disabled , all existing password will be clear.
Note to configure user password again otherwise all user password will be empty.

OK

Password Encryption: Click drop-down box to disable or enable MD5(Message-Digest Algorithm). It is a widely used cryptographic hash function producing a 128-bit (16-byte) hash value, typically expressed in text format as a 32 digit hexadecimal number. The default setting is disabled.

| User Name | Description |
|-----------|-------------|
| admin | |

Click **New** to add a new user account, then the following screen page appears.

Click **Edit** to view and edit a registered user setting.

Click **Delete** to remove a registered user setting.

| | |
|-------------------------|-----------------|
| Current/Total/Max Users | 1/ 1/10 |
| Account State | Enabled ▼ |
| User Name | admin |
| Password | |
| Retype Password | |
| Description | |
| Console Level | Administrator ▼ |

Current/Total/Max Users: View-only field

Current: This shows the number of current registered user.

Total: This shows the number of the registered users.

Max: This shows the maximum number available for registration. The maximum number is 10.

Account State: Enable or disable the selected account.

User Name: Specify the authorized user login name, up to 20 alphanumeric characters.

Password: Enter the desired user password, up to 20 alphanumeric characters.

Retype Password: Enter the password again to confirm.

Description: Enter a unique description up to 35 alphanumeric characters for this user. This is mainly for reference only.

Console Level: Select the preferred access level for this newly created account.

Administrator: Full access right, including maintaining the user account, system information, loading factory settings, etc.

Read & Write: Partial access right, unable to modify the system information, user account, load factory settings and firmware upgrade.

Read Only: Read only access right.

NOTE: If you forget the login password, the only way to gain access to the Web Management is to set the Managed Industrial Switch back to the factory default setting by pressing the Reset button for 10 seconds (The Reset button is located on the Front Panel of the Managed Industrial Switch.). When the Managed Industrial Switch returns back to the default setting, you can log in with the default login username and password (By default, no password is required. Leave the field empty and then press Login.)

Click the “**OK**” button to apply the settings.

RADIUS Configuration

Click **RADIUS Configuration** in **User Authentication** and then the following screen page appears.

| RADIUS Configuration | |
|---------------------------|-------------------|
| RADIUS Authentication | Disabled ▾ |
| RADIUS Secret Key | default |
| RADIUS Port | 1812 (1025-65535) |
| Retry Times | 0 ▾ |
| RADIUS Server Address | 0.0.0.0 |
| 2nd RADIUS Server Address | 0.0.0.0 |

OK

When **RADIUS Authentication** is enabled, User Login will be according to those settings on the RADIUS server(s).

NOTE: For advanced RADIUS Server setup, please refer to APPENDIX B or the “free RADIUS readme.txt” file on the disc provided with this product.

Secret Key: The word to encrypt data of being sent to RADIUS server.

RADIUS Port: The RADIUS service port on RADIUS server. The default value is “1812”.

Retry Time: Times of trying to reconnect if the RADIUS server is not reachable. The default value is “0”.

RADIUS Server Address: The IP address of the first RADIUS server.

2nd RADIUS Server Address: The IP address of the second RADIUS server.

3.3 Network Management

In order to enable network management of the Managed Industrial Switch, proper network configuration is required. To do this, click the folder **Network Management** from the left column and then the following screen page appears.

Network Configuration

| | | |
|--------------------|-------------------|---------------|
| MAC Address | 00:06:19:22:76:44 | |
| Configuration Type | Manual ▼ | Current State |
| IP Address | 192.168.0.1 | 192.168.0.1 |
| Subnet Mask | 255.255.255.0 | 255.255.255.0 |
| Gateway | 0.0.0.0 | 0.0.0.0 |

OK

1. **Network Configuration:** Set up the required IP configuration of the Managed Industrial Switch.
2. **System Service Configuration:** Set up the system service type.
3. **RS232/Telnet/Console Configuration:** Set up RS232/Telnet/Console configuration.
4. **Time Server Configuration:** Set up the time server's configuration.
5. **Time Range:** Set up an event at a period of time specified.
6. **Device Community:** View the registered SNMP community name list. Add a new community name or remove an existing community name.
7. **SNMPv3 USM User:** View the registered SNMPv3 user name list. Edit an existing user name.

8. **Trap Destination:** View the registered SNMP trap destination list. Add a new trap destination or remove an existing trap destination.
9. **Trap Configuration:** View the Managed Switch trap configuration. Enable or disable a specific trap.
10. **Syslog Configuration:** Enable or disable Log Server and set up its IP configuration.

3.3.1 Network Configuration

Click the option **Network Configuration** from the **Network Management** menu and then the following screen page appears.

| Network Configuration | | |
|-----------------------|-------------------|---------------|
| MAC Address | 00:06:19:00:01:00 | |
| Configuration Type | Manual ▼ | Current State |
| IP Address | 192.168.0.1 | 192.168.0.1 |
| Subnet Mask | 255.255.255.0 | 255.255.255.0 |
| Gateway | 0.0.0.0 | 0.0.0.0 |
| OK | | |

MAC Address: This view-only field shows the unique and permanent MAC address pre-assigned to the Managed Industrial Switch. You cannot change the Managed Industrial Switch's MAC address.

Configuration Type: There are two configuration types that users can select from the pull-down menu: **"DHCP"** and **"Manual"**. When **"DHCP"** is selected and a DHCP server is also available on the network, the Managed Industrial Switch will automatically get the IP address from the DHCP server. If **"Manual"** is selected, users need to specify the IP address, Subnet Mask and Gateway.

NOTE: This Managed Industrial Switch supports auto-provisioning function that enables DHCP clients to automatically download the latest firmware and configuration image from the server. For information about how to set up a DHCP server, please refer to [APPENDIX A](#).

IP Address: Enter the unique IP address for this Managed Industrial Switch. You can use the default IP address or specify a new one when the address duplication occurs or the address does not match up with your network. (The default factory setting is 192.168.0.1.)

Subnet Mask: Specify the subnet mask. The default subnet mask values for the three Internet address classes are as follows:

- Class A: 255.0.0.0
- Class B: 255.255.0.0
- Class C: 255.255.255.0

Gateway: Specify the IP address of a gateway or a router, which is responsible for the delivery of the IP packets sent by the Managed Industrial Switch. This address is required when the Managed Industrial Switch and the network management station are on different networks or subnets. The default value of this parameter is 0.0.0.0, which means no gateway exists and the network management station and Managed Industrial Switch are on the same network.

3.3.2 System Service Configuration

Click the option **System Service Configuration** from the **Network Management** menu and then the following screen page appears.

| System Service Configuration | |
|------------------------------|-----------|
| Telnet Service | Telnet ▼ |
| SNMP Service | Enabled ▼ |
| Web Service | Enabled ▼ |
| OK | |

Telnet Service: Select **Disabled** or **Telnet** or **SSH** for the system service type.

SNMP Service: Select Disabled or Enabled for the system service type.

Web Service: It is a view-only field. Web service cannot be disabled.

Click the “**OK**” button to apply the settings.

3.3.3 RS232/Telnet/Console Configuration

Click the option **RS232/Telnet/Console Configuration** from the **Network Management** menu and then the following screen page appears.

| RS232/Telnet/Console Configuration | |
|------------------------------------|--|
| Baud Rate | 9600bps |
| Stop Bits | 1 |
| Parity Check | None |
| Word Length | 8 |
| Flow Control | None |
| Telnet Port | <input type="text" value="23"/> |
| System Time Out | <input type="text" value="300"/> (5-300)Secs |

OK

Baud Rate: View-only field that displays *9600bps* for RS-232 setting

Stop Bits: View-only field that displays *1* for RS-232 setting

Parity Check: View-only field that displays *None* for RS-232 setting

Word Length: View-only field that displays *8* for RS-232 setting

Flow Control: View-only field that displays *None* for RS-232 setting

Telnet Port: Specify the desired TCP port number for the Telnet console. The default TCP port number of Telnet is 23.

System Time Out: Specify the desired time that the Managed Industrial Switch will wait before disconnecting an inactive console/telnet. The default value is 300 seconds.

Click the “**OK**” button to apply the settings.

3.3.4 Time Server Configuration

Click the option **Time Server Configuration** from the **Network Management** menu and then the following screen page appears.

Time Server Configuration

| | |
|--------------------------|------------------|
| Time Synchronization | Disabled ▼ |
| Time Server Address | 0.0.0.0 |
| 2nd Time Server Address | 0.0.0.0 |
| Synchronization Interval | 24 Hour ▼ |
| Time Zone | GMT-11:00 Apia ▼ |
| Daylight Saving Time | Disabled ▼ |

NOTE: The offset of start time and end time should be greater than 1 hour, or the effect is unpredictable.

Time Synchronization: Enable or disable the time synchronization.

Time Server Address: Specify the primary NTP time server address.

2nd Time Server Address: When the default time server is down, the Managed Industrial Switch will automatically connect to the 2nd time server.

Synchronization Interval: The time interval to synchronize from NTP time server. The allowable value is from 1 hour to 24 hours.

Time Zone: Select the appropriate time zone from the pull-down menu.

Daylight Saving Time — To enable or disable the daylight saving time function. Daylight saving time is the practice of advancing clocks during summer months by one hour so that evening daylight lasts an hour longer, while sacrificing normal sunrise times.

Daylight Saving Time Date Start — Click the pull-down menu to select the annual start date of daylight saving time.

Daylight Saving Time Date End — Click the pull-down menu to select the annual end date of daylight saving time.

Daylight Saving Time Recurring Start — Click the pull-down menu to select the start date of daylight saving time using calendar algorithm.

Daylight Saving Time Recurring Start — Click the pull-down menu to select the start date of daylight saving time using calendar algorithm.

Click the “**OK**” button to apply the settings.

3.3.5 Time Range

This command defines a time interval to be activated on a daily or weekly basis. This is convenient to assign when a function should automatically take effect. Before using the function, make sure that gateway is set under either IPv4 mode in **Network Configuration** (Section 3.3.1) and time server is configured in **Time Server Configuration** (Section 3.3.4). Time Range related function scheduling will only take effect when Switch system time is sync with NTP time server.

| Time Range | | |
|------------|------------|-------------|

Name: Specify a name to the time interval. It receives 32 characters at most.

Absolute: An absolute interval to enable a function. Specify an absolute start time or end time to a time interval.

Where:

Hour→0-23

Minute→0-59

Date→1-31

Month→JAN, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP, OCT, NOV, DEC

Year→2000-2097

Note: No start time assigned refers to start immediately. One absolute start time can be set at most. No end time assigned refers to run a function continuously. One absolute end time can be set at most.

Periodic: An interval to enable a function on a weekly basis. The periodic interval only takes effect within specified absolute interval. Specify weekly recurring time interval. Two periodic intervals can be set at most.

Where:

81

Hour→0-23

Minute→0-59

Days(7 days)→ including Monday(Mon), Tuesday(Tue), Wednesday(Wed), Thursday(Thu), Friday(Fri), Saturday(Sat), Sunday(Sun).

Periodic List: An interval to enable a function on a daily basis. The periodic list interval only takes effect within specified absolute interval. Specify a list of days in a week for periodic run.

Where:

Hour→0-23

Minute→0-59

days(7 days)→ including Monday(Mon), Tuesday(Tue), Wednesday(Wed), Thursday(Thu), Friday(Fri), Saturday(Sat), Sunday(Sun).

Cross-day setting is feasible. In other words, the second occurrence of time can be set on the following day, e.g. "22:00-2:00".

Note: Two set of periodic list intervals can be set at most.

Under a time range name, user may add one absolute start time and one absolute end time at most. Users may also add two optional time ranges at most using Periodic and Periodic List time range.

For example, Users may set:

1. Two Periodic in time range, or
2. One Periodic and one Periodic List in time range, or
3. Two Periodic Lists in time range.

3.3.6 Device Community

Click the option **Device Community** from the **Network Management** menu and then the following screen page appears.

| Community | Description |
|-----------|-----------------|
| public | Default_Account |
| admin | Default_Account |

New Edit Delete

Click **New** to add a new community, then the following screen page appears.

Click **Edit** to view and edit a community setting.

Click **Delete** to remove a community setting.

| | |
|--------------------------|------------------|
| Current/Total/Max Agents | 1/ 2/ 3 |
| Account State | Enabled ▼ |
| Community | public |
| Description | Default_Account |
| SNMP Level | Read and Write ▼ |

OK

Current/Total/Max Agents: View-only field.

Current: This shows the number of current community agents.

Total: This shows the total number of the community agents.

Max: This shows the maximum number available for configuration. The maximum number is 3.

Account State: Enable or disable the selected account.

Community: Specify the community name, up to 20 alphanumeric characters.

Description: Enter the description of the community, up to 20 alphanumeric characters.

SNMP Level: Select the preferred SNMP level for this newly created agent.

Administrator: Full access right.

Read & Write: Partial access right.

Read Only: Read only access right.

3.3.7 SNMPv3 USM User

Simple Network Management Protocol Version 3, SNMPv3 in short, features stronger security mechanism, including authentication and encryption that helps ensure that the message is from a valid source and scramble the content of a packet, to prevent from being learned by an unauthorized source. Select the option SNMPv3 USM User from the **Network Management** menu, then the **SNMPv3 USM User** page shows up.

Note: The SNMPv3 user account is generated from “User Authentication” (Section 4.2)

SNMPv3 USM User

| UserName | Authentication | Private |
|----------|----------------|---------|
| admin | None | None |

Edit

Click “**Edit**” for further settings.

| SNMPv3 USM User | |
|--------------------------|----------------------|
| Current/Total/Max Agents | 1/ 1/10 |
| Account State | Enabled |
| UserName | admin |
| Authentication | None ▼ |
| Auth-Password | <input type="text"/> |
| Private | None ▼ |
| Priv-Password | <input type="text"/> |
| SNMP Level | Administrator |

OK

Current/Total/Max Agents: View-only field.

Current: This shows the number of currently registered communities.

Total: This shows the number of total registered community users.

Max Agents: This shows the number of maximum number available for registration. The default maximum number is 10.

Account State: View-only field that shows this user account is enabled or disabled.

User Name: View-only field that shows the authorized user login name.

Authentication: This is used to ensure the identity of users. The following is the method to perform authentication.

None: Disable authentication function. Click “None” to disable it.

MD5(Message-Digest Algorithm): A widely used cryptographic hash function producing a 128-bit (16-byte) hash value, typically expressed in text format as a 32 digit hexadecimal number. Click “MD5” to enable authentication.

SHA(Secure Hash Algorithm): A 160-bit hash function which resembles the said MD5 algorithm. Click “SHA” to enable authentication.

Auth-Password: Specify the passwords, up to 20 characters.

Private: It allows for encryption of SNMP v3 messages to ensure confidentiality of data. The following is the method to perform encryption.

None: Disable Private function. Click “None” to disable it.

DES(Data Encryption Standard): An algorithm to encrypt critical information such as message text message signatures...etc. Click “DES” to enable it.

Priv-Password: Specify the passwords, up to 20 characters.

SNMP-Level: View-only field that shows user’s authentication level.

Administrator: Full access right including maintaining user account & system information, load factory settings ...etc.

Read & Write: Full access right but cannot modify user account & system information, cannot load factory settings.

Read Only: Allow to view only.

A combination of a security event as below indicates which security mechanism is used when handling an SNMP packet.

| Authentication | Private | Result |
|---|-------------------------------|--|
| None | None | Uses a username match for authentication |
| Message Digest Algorithm(MD5) or Secure Hash Algorithm(SHA) | None | Provides authentication based on the Hashed Message Authentication Code(HMAC)-MD5 or HMAC-SHA algorithms. |
| MD5 or SHA | Data Encryption Standard(DES) | Provides authentication based on the Hashed Message Authentication Code(HMAC)-MD5 or HMAC-SHA algorithms. What’s more, provides DES 56-bit encryption based on the Cipher Block Chaining (CBC)-DES standard. |

3.3.8 Trap Destination

Click the option **Trap Destination** from the **Network Management** menu and then the following screen page appears.

| Trap Destination | | | |
|------------------|------------|-------------|-----------|
| Index | State | Destination | Community |
| 1 | Disabled ▾ | 0.0.0.0 | |
| 2 | Disabled ▾ | 0.0.0.0 | |
| 3 | Disabled ▾ | 0.0.0.0 | |

OK

Index: The index of the SNMP trap destination.

State: Select **Disabled** or **Enabled** for the trap destination.

Destination: Set up IP address for the trap destination.

Community: Set up community for the specific trap destination.

Click the “**OK**” button to apply the settings.

3.3.9 Trap Configuration

Click the option **Trap Configuration** from the **Network Management** menu and then the following screen page appears.

| Trap Configuration | |
|-----------------------------|-----------|
| Cold Start Trap | Enabled ▾ |
| Warm Start Trap | Enabled ▾ |
| Authentication Failure Trap | Enabled ▾ |
| Port Link Up/Down Trap | Enabled ▾ |
| Power Failure Trap | Enabled ▾ |

OK

Cold Start Trap: Select **Disabled** or **Enabled** for the SNMP trap.

Warm Start Trap: Select **Disabled** or **Enabled** for the SNMP trap.

Authentication Failure Trap: Select **Disabled** or **Enabled** for the SNMP trap.

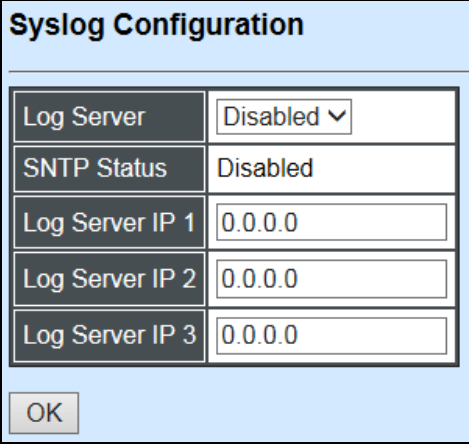

Port Link Up/Down Trap: Select **Disabled** or **Enabled** for the SNMP trap.

Power Failure Trap: Select **Disabled** or **Enabled** for the SNMP trap.

Click the **“OK”** button to apply the settings.

3.3.10 Syslog Configuration

Click the option **Syslog Configuration** from the **Network Management** menu and then the following screen page appears.

The image shows a 'Syslog Configuration' dialog box with a light blue header and footer. The main area contains a table with five rows. The first row has a 'Log Server' label and a dropdown menu showing 'Disabled'. The second row has an 'SNTP Status' label and a text field containing 'Disabled'. The next three rows have labels 'Log Server IP 1', 'Log Server IP 2', and 'Log Server IP 3', each followed by a text field containing '0.0.0.0'. At the bottom left of the dialog is an 'OK' button.

| Syslog Configuration | |
|----------------------|------------|
| Log Server | Disabled ▾ |
| SNTP Status | Disabled |
| Log Server IP 1 | 0.0.0.0 |
| Log Server IP 2 | 0.0.0.0 |
| Log Server IP 3 | 0.0.0.0 |
| OK | |

Log server: Select **Disabled** or **Enabled** for the Log server.

SNTP Status: View-only field for the SNTP status

Log server IP 1: Set up the first Log server's IP address.

Log server IP 2: Set up the second Log server's IP address if needed

Log server IP 3: Set up the third Log server's IP address if needed.

Click the **“OK”** button to apply the settings.

3.4 Switch Management

To manage the Managed Industrial Switch and set up required switching functions, click the folder **Switch Management** from the left column and then several options and folders will be displayed for your selection.

The screenshot displays a web-based configuration interface for a Managed Industrial Switch. The interface is divided into two main sections. The left section is a tree view showing the hierarchy of configuration options. The right section is the 'Switch Configuration' panel, which contains a table of settings.

| Switch Configuration | |
|------------------------|-----------------|
| MAC Address Aging Time | 300 (4-900)Secs |
| SFP Polling | Enabled ▼ |
| Statistics Polling | Enabled ▼ |

Below the table is an 'OK' button.

1. **Switch Configuration:** Set up MAC address aging time, and enable/disable SFP Polling and Statistics Polling.
2. **Broadcast Storm Control:** Prevent the Managed Industrial Switch from broadcast storms.
3. **Port Configuration:** Set up the port state, port type and flow control.
4. **Rate Limit Configuration:** Enable or disable Port Priority and set up Port Rate Limit, etc..
5. **QoS Priority Configuration:** Set up QoS Priority based on Port-based, IEEE 802.1p, ToS/DSCP and Qos mode.
6. **Link Aggregation:** Set up port trunk and LACP port configuration.
7. **Rapid Spanning Tree:** Set up RSTP switch settings, aggregated port settings, physical port settings, etc.
8. **802.1X Configuration:** Set up the 802.1X system, port Admin state, port reauthenticate.
9. **Static MAC Table Configuration:** Set up MAC address, enable or disable MAC security, etc.
10. **VLAN Configuration:** Set up IEEE 802.1q Tag VLAN and Port Based VLAN.

11.Static MAC Table Configuration: Set up Static MAC Table.

12.IGMP Snooping: Set up IGMP Snooping function.

13.LLDP Configuration: Enable or disable LLDP on ports and set up LLDP-related attributes.

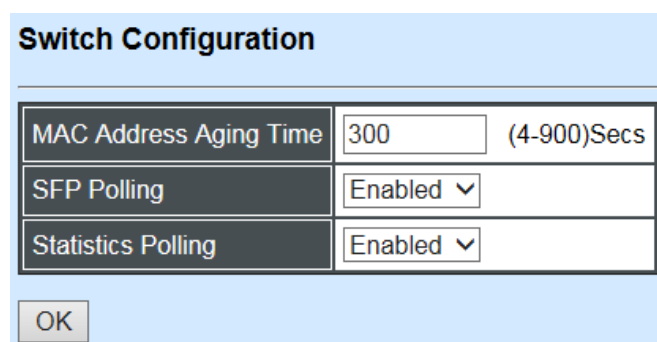

14.Loop Detection: Enable or disable Loop Detection function.

15.Ring Detection: Set up Ring Detection.

16.DHCP Snooping: Set up DHCP Snooping & Trust Port configuration.

3.4.1 Switch Configuration

Click the option **Switch Configuration** from the **Switch Management** menu and then the following screen page appears.

A screenshot of a 'Switch Configuration' dialog box. It has a light blue header with the title 'Switch Configuration'. Below the header is a table with three rows. The first row is 'MAC Address Aging Time' with a text input field containing '300' and a label '(4-900)Secs'. The second row is 'SFP Polling' with a dropdown menu showing 'Enabled'. The third row is 'Statistics Polling' with a dropdown menu showing 'Enabled'. At the bottom left of the dialog is an 'OK' button.

| Switch Configuration | |
|------------------------|--|
| MAC Address Aging Time | <input type="text" value="300"/> (4-900)Secs |
| SFP Polling | Enabled ▾ |
| Statistics Polling | Enabled ▾ |

OK

MAC Address Aging Time: Set up MAC Address Aging Time manually. Entries in the MAC address table containing source MAC addresses and their associated ports will be deleted if they are not accessed within the aging time. The default setting is “300” seconds.

SFP Polling: Enable or disable SFP Polling.

Statistics Polling: Enable or disable Statistics Polling.

Click the “**OK**” button to apply the settings.

3.4.2 Broadcast Storm Control

Click the option **Broadcast Storm Control** from the **Switch Management** menu and then the following screen page appears.

| Broadcast Storm Control | |
|---------------------------|------------|
| Storm Protection | Disabled ▼ |
| Storm Rate(kbps) | 64 |
| Storm Rate Bandwidth(bps) | 64.0 k |
| OK | |

Storm Protection: Enable or disable Storm Protection function.

Storm Rate (kbps): Set up storm rate value. Packets exceeding the value will be dropped. (The Storm Rate range can be configured within 32~1000000kbps), the default value is 64.

Storm Rate Bandwidth (bps): Display the current configured storm rate bandwidth.

Click the “**OK**” button to apply the settings.

3.4.3 Port Configuration

Click the option **Port Configuration** from the **Switch Management** menu and then the following screen page appears.

| Port Configuration | |
|----------------------|--------------------|
| Port Number | Port 1 ▼ |
| Port State | Enabled ▼ |
| Preferred Media Type | Copper ▼ |
| Port Type | Auto-Negotiation ▼ |
| Port Speed | 1000Mbps ▼ |
| Duplex | Full ▼ |
| Flow Control | Disabled ▼ |
| Description | |
| OK | |

Port Number: Click the pull-down menu to select the port number for configuration.

Port State: Enable or disable the selected port.

Preferred Media Type: This shows the media type (either Fiber or Copper) of the selected port. This field is open to select only when the selected port has two media type.

Port Type: Select Auto-Negotiation or Manual mode as the port type.

Port Speed: When you select Manual port type, you can further specify the transmission speed (10Mbps/100Mbps/1000Mbps/Auto-Sense) of the port(s).

Duplex: When you select Manual port type, you can further specify the current Duplex operation mode (full or half duplex) of the port(s).

Flow Control: Enable or disable Flow Control function.

Description: Add a remark to the description box for the port, up to 35 characters.

Click the “OK” button to apply the settings.

3.4.4 Rate Limit Configuration

Click the folder **Rate Limit Configuration** from the left column and then the following screen page appears.

| Rate Limit Configuration | | | | | | | | | | |
|--------------------------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Port Number | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| Ingress Rate | Off ▾ | Off ▾ | Off ▾ | Off ▾ | Off ▾ | Off ▾ | Off ▾ | Off ▾ | Off ▾ | Off ▾ |
| Ingress Limiter(kbps) | 64 | 64 | 64 | 64 | 64 | 64 | 64 | 64 | 64 | 64 |
| Ingress Bandwidth(bps) | 64.0 k | 64.0 k | 64.0 k | 64.0 k | 64.0 k | 64.0 k | 64.0 k | 64.0 k | 64.0 k | 64.0 k |
| Egress Rate | Off ▾ | Off ▾ | Off ▾ | Off ▾ | Off ▾ | Off ▾ | Off ▾ | Off ▾ | Off ▾ | Off ▾ |
| Egress Limiter(kbps) | 64 | 64 | 64 | 64 | 64 | 64 | 64 | 64 | 64 | 64 |
| Egress Bandwidth(bps) | 64.0 k | 64.0 k | 64.0 k | 64.0 k | 64.0 k | 64.0 k | 64.0 k | 64.0 k | 64.0 k | 64.0 k |

Note: 10M = 10000, 100M = 100000, 1G = 1000000

OK

Ingress Rate: Click the pull-down menu to set up Port Ingress Rate, on or off.

Ingress Limiter: Enter ingress bandwidth for each port (the allowable bandwidth is between 32 and 1000000).

Ingress Bandwidth (Kbps): Display current configured ingress bandwidth.

Egress Rate: Click the pull-down menu to set up Port Egress Rate, on or off.

Egress Limiter (Kbps): Enter egress bandwidth for each port (the allowable bandwidth is between 32 and 1000000).

Egress Bandwidth (Kbps): Display current configured egress bandwidth.

Click the “**OK**” button to apply the settings.

3.4.5 QoS Priority Configuration

Network traffic is always unpredictable and the only basic assurance that can be offered is the best effort traffic delivery. To overcome this challenge, Quality of Service (QoS) is applied throughout the network. It ensures that network traffic is prioritized according to specified criterion and receives preferential treatments.

QoS enables users to assign various grades of network service to different types of traffic, such as multi-media, video, protocol-specific, time critical, and file-backup traffic. Click the option **QoS Priority Configuration** from the **Switch Management** menu and then the following screen page appears.

QoS Priority Configuration

QoS Priority:

| | | |
|---------------------------------------|-------------------------------|------|
| Priority Mode | Disable ▾ | |
| Queue Mode | Strict ▾ | |
| Queue Weight(Q0:Q1:Q2:Q3:Q4:Q5:Q6:Q7) | 1 : 2 : 3 : 4 : 5 : 6 : 7 : 8 | |
| 802.1p Priority Map | 0 ▾ | Q0 ▾ |
| DSCP Priority Map | DSCP(0) ▾ | Q0 ▾ |

Note: Uses 802.1p priority mode must select 802.1Q vlan mode.

User Priority:

| | | | | | | | | |
|---------------|---|---|----|---|-----|---|---|---|
| Port Number | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Port Priority | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Port Number | 9 | | 10 | | CPU | | | |
| Port Priority | 0 | | 0 | | 0 | | | |

OK

QoS Priority

Priority Mode: Click the pull-down menu to select the QoS Priority Mode.

IEEE 802.1p: IEEE 802.1p mode utilizes p-bits in VLAN tag for different services.

DSCP: DSCP mode utilizes TOS field in IPv4 header for different services.

Disable: Disable QoS.

Queue Mode: Click the pull-down menu to select the Queue Mode.

Strict mode: This indicates that egress traffic is prioritized based on a queue value assigned to each port. For example, traffic assigned to queue 3 will be transmitted first when congestion happens. The traffic assigned to queue 2 will not be transmitted until queue 3's traffic is done transmitting, and so forth.

Weight mode: This mode enables users to assign different weights to 8 queues, which have fair opportunity of dispatching. Each queue has the specific amount of bandwidth according to its assigned weight.

Queue Weight (Q0:Q1:Q2:Q3:Q4:Q5:Q6:Q7): Specify the weight of eight queues.

802.1p Priority Map: Assign a tag priority to the specific queue.

DSCP Priority Map: Assign a DSCP priority to the specific queue. The DSCP priority includes DSCP (0) to DSCP (63), and the priority queue includes Q0 to Q7.

User Priority

Port Priority: Set up a priority to each port for ingress traffic with allowable value 0~7.

There are eight priority levels that you can choose to classify data packets. Choose one of the listed options from the pull-down menu for CoS (Class of Service) priority tag values. The default value is "0".

The default 802.1p settings are shown in the following table:

| | | | | | | | | |
|----------------|-----|-----|-----|--------|--------|--------|------|------|
| Priority Level | Low | Low | Low | Normal | Medium | Medium | High | High |
| 802.1p Value | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |

Note: 802.1p priority mode can only be applied under 802.1q VLAN mode.

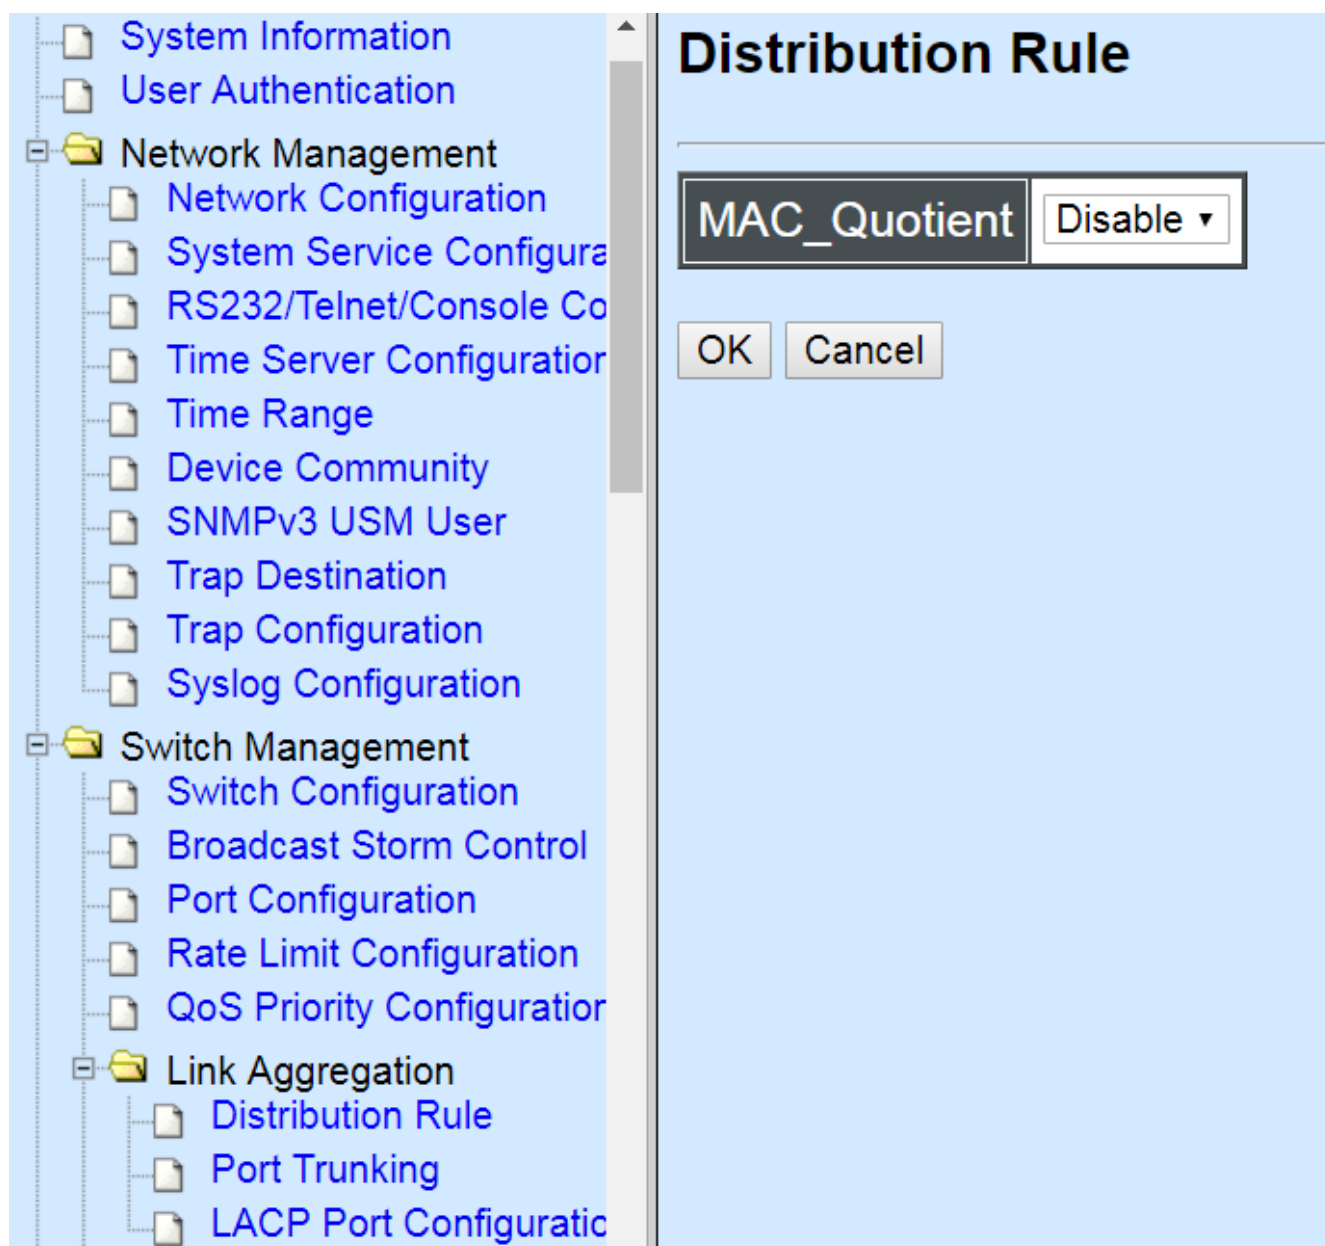

3.4.6 Link Aggregation

Link aggregation is an inexpensive way to set up a high-speed backbone network that transfers much more data than any one single port. Devices can deliver more data without replacing everything and buying new hardware.

For most backbone installations, it is common to install more cabling or fiber optic pairs than initially necessary, even if there is no immediate need for the additional cabling. This action is taken because labor costs are higher than the cost of the cable. Running extra cable reduces future labor costs if networking needs changes. Link aggregation can allow the use of these extra cables to increase backbone speeds with little or no extra cost if ports are available.

By Link Aggregation, devices are allowed to communicate simultaneously at their full single-port speed while any one single device would not occupy all available backbone capacities.

Click the **Link Aggregation** folder from the **Switch Management** menu and then two options will be displayed.

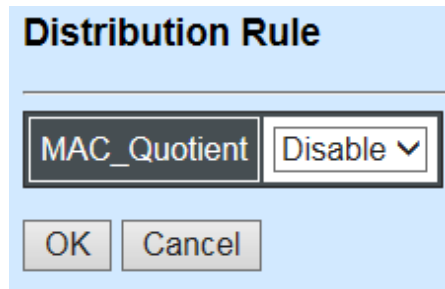

Distribution Rule: Configure the distribution rule of Port Trunking group(s).

Port Trunking: Create, edit or delete port trunking group(s).

3.4.6.1 Distribution Rule

Click **Distribution Rule** from the **Link Aggregation** menu, the following screen page appears.

MAC_Quotient: Enable or disable distributing packets according to the MAC address.

Click the “**OK**” button to apply the settings.

1. Identifying MAC

It checks the last three bits of Source MAC and Dst. MAC and XOR algorithm distributes them.

XOR Algorithm:

$0 \& 0 = 0$

$0 \& 1 = 1$

$1 \& 0 = 1$

$1 \& 1 = 0$

Three bits results in eight combinations (0~7), it is used to determine which packet should be sent to.

Example:

Source MAC 11:22:33:44:55:66

↑ The last digit 6 occupies 4 bits (Use the last three bits \Rightarrow 0100)

Dst. MAC 33:44:55:66:77:88

↑ The last digit 8 occupies 4 bits (Use the last three bits \Rightarrow 1000)

XOR Algorithm:

Src. MAC – 1 1 0

Dst. MAC – 0 0 0

Result – 1 1 0 = 6

2. MAC Quotient Distribution

Example 1:

Assume that 2 ports are aggregated

$8(\text{bit})/2(\text{port}) = 4$ (Integer) \Rightarrow each port is evenly distributed 4 types of bit

$8(\text{bit})/2(\text{port}) = 0$ (Remainder) \Rightarrow The first ports will be distributed extra bits, if any

If enabled:

Port 1 will get 4 bits \Rightarrow 0, 1, 2, 3

Port 2 will get 4 bits \Rightarrow 4, 5, 6, 7

Example 2:

Assume that 3 ports are aggregated

$8(\text{bit})/2(\text{port}) = 2$ (Integer) \Rightarrow each port is distributed 2 types of bit at least

$8(\text{bit})/2(\text{port}) = 2$ (Remainder) \Rightarrow The first two ports will be additionally gotten 1 bit respectively

If enabled:

Port 1 will get 3 bits \Rightarrow 0, 1, 2

Port 2 will get 3 bits \Rightarrow 3, 4, 5

Port 3 will get 2 bits \Rightarrow 6, 7

Example 3:

Assume that 6 ports are aggregated

$8(\text{bit})/6(\text{port}) = 1 \text{ (Integer)} \Rightarrow$ each port is distributed 1 type of bit at least

$8(\text{bit})/6(\text{port}) = 2 \text{ (Remainder)} \Rightarrow$ The first two ports will be additionally gotten 1 bit respectively

If enabled:

Port 1 will get 2 bits \Rightarrow 0, 1

Port 2 will get 2 bits \Rightarrow 2, 3

Port 3 will get 1 bit \Rightarrow 4

Port 4 will get 1 bit \Rightarrow 5

Port 5 will get 1 bit \Rightarrow 6

Port 6 will get 1 bit \Rightarrow 7

3. Disabling MAC Quotient

If MAC Quotient is disabled, 8 types of bit are distributed in another way.

Example 1

Assume that 2 ports are aggregated

Port 1 will get 4 bits \Rightarrow 0, 2, 4, 6

Port 2 will get 4 bits \Rightarrow 1, 3, 5, 7

Example 2

Assume that 3 ports are aggregated

Port 1 will get 3 bits \Rightarrow 0, 3, 6

Port 2 will get 3 bits \Rightarrow 1, 4, 7

Port 3 will get 2 bits \Rightarrow 2, 5

3.4.6.2 Port Trunking

Click **Port Trunking** from the **Link Aggregation** menu and then the following screen page appears.

Port Trunking

Group Name

1

2

3

Please check the following two points before setting:

1. The Port Members are "Full Duplex".

2. The Port Members have the same speed.

OK

Current/Total/Max Groups: View-only field

Current: It shows the number of currently registered groups.

Total: It shows the number of total registered groups.

Max: It shows the maximum number of groups available for registration. The default maximum number is 5 groups.

Group Name: Specify a trunking group name, up to 15 alphanumeric characters.

Port Members: Select ports that belong to the specified trunking group. Please keep the rules below in mind when assigning ports to a trunking group:

- Must have 2 to 6 ports in each trunking group.
- Each port can only be grouped in one group.

Click **OK** and return back to **Link Aggregation** menu.

NOTE: All trunking ports in the group must be members of the same VLAN, and QoS default priority configurations must be identical. Furthermore, all of the LACP aggregated links must be in the same speed and should be configured as full duplex.

3.4.6.3 LACP Port Configuration

The Industrial Switch supports dynamic Link Aggregation Control Protocol (LACP) which is specified in IEEE 802.3ad. Static trunks have to be manually configured at both ends of the link. In other words, LACP configured ports can automatically negotiate a trunked link with LACP configured ports on other devices. You can configure any number of ports on the Managed Switch as LACP, as long as they are not already configured as part of a static trunk. If ports on other devices are also configured as LACP, the Managed Switch and the other devices will negotiate a trunk link between them. If an LACP trunk consists of more than four ports, all other ports will be placed in a standby mode. Should one link in the trunk fail, one of the standby ports will automatically be activated to replace it.

Configure Port Protocol:

Click the option **LACP Port Configuration** from the **Link Aggregation** menu and then select “Role” from the pull-down menu of Select Setting. The screen page is shown below.

LACP Port Configuration

Select Setting

KeyValue ▾

Port KeyValue

| | | | | | | | |
|---|---|---|---|----|---|---|---|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 9 | | | | 10 | | | |
| 0 | | | | 0 | | | |

OK

This allows LACP to be enabled (active or passive) or disabled on each port.

Configure Key Value:

Select “Key Value” from the pull-down menu of Select Setting.

LACP Port Configuration

Select Setting

KeyValue ▾

Port KeyValue

| | | | | | | | |
|---|---|---|---|----|---|---|---|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 9 | | | | 10 | | | |
| 0 | | | | 0 | | | |

OK

Ports in an aggregated link group must have the same LACP port Key. In order to allow a port to join an aggregated group, the port Key must be set to the same value. The range of key value is between 0 and 255. When key value is set to 0, the port Key is automatically set by the Managed Switch.

Configure Port Role:

Select “Role” from the pull-down menu of Select Setting.

LACP Port Configuration

Select Setting Role ▾

Port Role

| | | | | | | | |
|------------------------|---|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Disable ▾ | Disable ▾ | Disable ▾ | Disable ▾ | Disable ▾ | Disable ▾ | Disable ▾ | Disable ▾ |
| 9 | 10 | | | | | | |
| Disable ▾ | Disable ▾ Disable Passive Active | | | | | | |

OK

“Disable” Port Role: Disable LACP on specified port(s)

“Active” Port Role: Active LACP ports are capable of processing and sending LACP control frames. This allows LACP compliant devices to negotiate the aggregated link so that the group may be changed dynamically as required. In order to utilize the ability to change an aggregated port group, that is, to add or remove ports from the group, at least one of the participating devices must designate LACP ports as active. Both devices must support LACP.

“Passive” Port Role: LACP ports that are designated as passive cannot initially send LACP control frames. In order to allow the linked port group to negotiate adjustments and make changes dynamically, one end of the connection must have “active” LACP ports.

3.4.7 Rapid Spanning Tree

The Spanning Tree Protocol (STP), defined in the IEEE Standard 802.1D, creates a spanning tree within a mesh network of connected layer-2 bridges (typically Ethernet switches) and disables the links which are not part of that tree, leaving a single active path between any two network nodes.

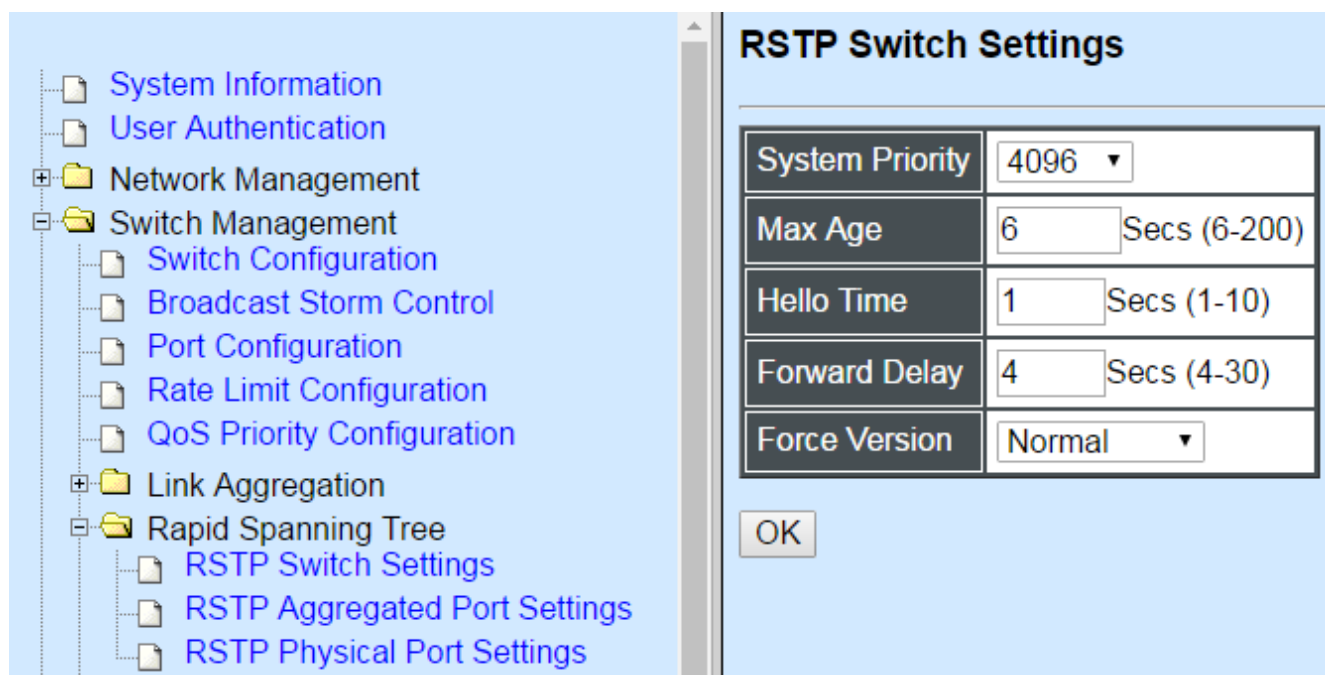

Multiple active paths between network nodes cause a bridge loop. Bridge loops create several problems. First, the MAC address table used by the switch or bridge can fail, since the same MAC addresses (and hence the same network hosts) are seen on multiple ports. Second, a broadcast storm occurs. This is caused by broadcast packets being forwarded in an endless loop between switches. A broadcast storm can consume all available CPU resources and bandwidth.

Spanning tree allows a network design to include spare (redundant) links to provide automatic backup paths if an active link fails, without the danger of bridge loops, or the need for manually enabling/disabling these backup links.

To provide faster spanning tree convergence after a topology change, an evolution of the Spanning Tree Protocol: Rapid Spanning Tree Protocol (RSTP), introduced by IEEE with

document 802.1w. RSTP, is a refinement of STP; therefore, it shares most of its basic operation characteristics. This essentially creates a cascading effect away from the root bridge where each designated bridge proposes to its neighbors to determine if it can make a rapid transition. This is one of the major elements which allows RSTP to achieve faster convergence times than STP.

Click the folder **Rapid Spanning Tree** from the **Switch Management** menu and then three options within this folder will be displayed as follows.

1. **RSTP Switch Settings:** Set up system priority, max Age, hello time, etc.
2. **RSTP Aggregated Port Settings:** Set up aggregation, path cost, priority, edge, etc.
3. **RSTP Physical Port Settings:** Set up physical, ability and edge status of port.

3.4.7.1 RSTP Switch Settings

Click the option **RSTP Switch Settings** from the **Rapid Spanning Tree** menu and then the following screen page appears.

RSTP Switch Settings

| | |
|-----------------|-------------------------------|
| System Priority | 4096 ▼ |
| Max Age | 6 <small>Secs (6-200)</small> |
| Hello Time | 1 <small>Secs (1-10)</small> |
| Forward Delay | 4 <small>Secs (4-30)</small> |
| Force Version | Compatible ▼ |

System Priority: Each interface is associated with a port (number) in the STP code. And, each switch has a relative priority and cost that is used to decide what the shortest path is to forward a packet. The lowest cost path is always used unless the other path is down. If you have multiple bridges and interfaces then you may need to adjust the priority to achieve optimized performance. The default setting is “4096”.

The Managed Switch with the lowest priority will be selected as the root bridge. The root bridge is the “central” bridge in the spanning tree.

Max Age: If another switch in the spanning tree does not send out a hello packet for a long period of time, it is assumed to be disconnected. This default value is set “6” seconds.

Hello Time: Periodically, a hello packet is sent out by the Root Bridge and the Designated Bridges that are used to communicate information about the topology throughout the entire Bridged Local Area Network. The default setting is set “1” second.

Forward Delay: It is the time spent in each Listening and Learning state before the Forwarding state is entered. This delay occurs when a new bridge comes onto a busy network. The default setting is “4” seconds.

Force Version: Set and show the RSTP protocol to be used. Normal - use RSTP, Compatible - compatible with STP.

3.4.7.2 RSTP Aggregated Port Settings

Click the option **RSTP Aggregated Port Settings** from the **Rapid Spanning Tree** menu and then the following screen appears.

RSTP Aggregated Port Settings

| | |
|--------------------------|----------------|
| State | Enabled ▾ |
| Path Cost (0-2000000000) | 1 |
| Priority | 16 ▾ |
| Edge | Disable ▾ |
| Point to Point | Forced False ▾ |

State: Enable or disable configured trunking groups in RSTP mode.

Path Cost: This parameter is used by the RSTP to determine the best path between devices. Therefore, lower values should be assigned to ports attached to faster media, and higher values assigned to ports with slower media. 0 means auto-generated path cost. The default setting is “1”.

Priority: You can choose Port Priority available value: 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224 and 240. A higher priority will designate the interface to forward packets first. A lower number denotes a higher priority. The default value is 16.

Edge: If you know a port is directly connected to an end device (that doesn't support RSTP) then set it as an edge port to ensure maximum performance. This will tell the switch to immediately start forwarding traffic on the port and not bother trying to establish a RSTP connection. Otherwise, turn it off.

Point to Point:

Forced True: indicates a point-to-point (P2P) shared link. P2P ports are similar to edge ports; however, they are restricted in that a P2P port must operate in full duplex. Similar to edge ports, P2P ports transit to a forwarding state rapidly thus benefiting from RSTP.

Forced False: the port cannot have P2P status.

Auto: allows the port to have P2P status whenever possible and operates as if the P2P status were true. If the port cannot maintain this status, (for example if the port is forced to half-duplex operation) the P2P status changes to operate as if the P2P value were false. The default setting for this parameter is true.

3.4.7.3 RSTP Physical Port Settings

Click the option **RSTP Physical Port Settings** from the **Rapid Spanning Tree** menu and then the following screen appears.

Configure Port State:

Select “State” from the drop-down box of Select Setting.

RSTP Physical Port Settings

Select Setting

State

Port State

| | | | | | | | |
|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 9 | | | | 10 | | | |
| <input type="checkbox"/> | | | | <input type="checkbox"/> | | | |

OK

This allows ports to be enabled or disabled. When it is On, RSTP is enabled.

Configure Port Path Cost:

Select “Path Cost” from the pull-down menu of Select Setting.

RSTP Physical Port Settings

Select Setting

Path Cost

Port Path Cost(0-200000000)

| | | | | | | | |
|---|---|---|---|----|---|---|---|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 9 | | | | 10 | | | |
| 0 | | | | 0 | | | |

OK

This sets up each port’s path cost. The default value is “0”.

Configure Port Priority:

Select “Priority” from the pull-down menu of Select Setting.

RSTP Physical Port Settings

Select Setting

Priority

Port Priority

| | | | | | | | |
|---|---|---|---|----|---|---|---|

| 9 | | | | 10 | | | |
| <input type="checkbox"/> | | | | <input type="checkbox"/> | | | |

OK

Set the port to “enabled” or “disabled”. When it is On, Port Edge is enabled.

Configure Port Point2point:

Select “Point2point” from the pull-down menu of Select Setting.

RSTP Physical Port Settings

Select Setting

Point2point ▾

Port Point2point

| | | | | | | | |
|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Forced True ▾ | Forced True ▾ | Forced True ▾ | Forced True ▾ | Forced True ▾ | Forced True ▾ | Forced True ▾ | Forced True ▾ |
| 9 | | | | 10 | | | |
| Forced True ▾ | | | | Forced True ▾ | | | |

OK

Set up the Point to Point setting. The default setting is “Forced True”.

3.4.8 VLAN Configuration

A Virtual Local Area Network (VLAN) is a network topology configured according to a logical scheme rather than the physical layout. VLAN can be used to combine any collections of LAN segments into a group that appears as a single LAN. VLAN also logically segments the network into different broadcast domains. All broadcast, multicast, and unknown packets entering the Switch on a particular VLAN will only be forwarded to the stations or ports that are members of that VLAN.

VLAN can enhance performance by conserving bandwidth and improve security by limiting traffic to specific domains. A VLAN is a collection of end nodes grouped by logics instead of physical locations. End nodes that frequently communicate with each other are assigned to the same VLAN, no matter where they are physically located on the network. Another benefit of VLAN is that you can change the network topology without physically moving stations or changing cable connections. A station can be ‘moved’ to another VLAN and thus communicates with its members and shares its resources, simply by changing the port settings from one VLAN to another. This allows VLAN to accommodate network moves, changes and additions with the greatest flexibility.

The Managed Industrial Switch supports two types of VLAN: **Port Based VLAN** and **IEEE 802.1q Tag VLAN**.

IEEE 802.1Q VLAN Concepts

Introduction of 802.1Q frame format:

| | | | |
|---------|-----------------------|-------------------|--|
| PRE | Preamble | 62 bits | Used to synchronize traffic |
| SFD | Start Frame Delimiter | 2 bits | Marks the beginning of the header |
| DA | Destination Address | 6 bytes | The MAC address of the destination |
| SA | Source Address | 6 bytes | The MAC address of the source |
| TCI | Tag Control Info | 2 bytes | Set to 0x8100 for 802.1p and Q tags |
| P | Priority | 3 bits | Indicates 802.1p priority level 0-7 |
| C | Canonical Indicator | 1 bit | Indicates if the MAC addresses are in the canonical format – Ethernet is set to “0”. |
| VID | VLAN Identifier | 12 bits | Indicates the VLAN (0-4095) |
| T/L | Type/Length Field | 2 bytes | Ethernet II “type” or 802.3 “length” |
| Payload | | < or = 1500 bytes | User data |
| FCS | Frame Check Sequence | 4 bytes | Cyclical Redundancy Check |

Click the folder **VLAN Configuration** from the **Switch Management** menu and then the following screen page appears.

RSTP Physical Port Settings

Select Setting: State

Port State

| | | | | | | | |

| 9 | | | | 10 | | | |
| <input type="checkbox"/> | | | | <input type="checkbox"/> | | | |

OK

Port Based VLAN: Configure Port-Based VLAN settings.

IEEE 802.1Q Tag VLAN: Configure IEEE 802.1Q Tag VLAN settings.

3.4.8.1 Port Based VLAN

Port-Based VLAN can effectively divide one network into multiple logical networks. Broadcast, multicast and unknown packets will be limited within the VLAN. Port-Based VLAN is uncomplicated and fairly rigid in implementation, and useful for network administrators who want to quickly and easily set up VLAN so as to isolate the effect of broadcast packets on their network.

Since source MAC addresses and VID of the packets are listed in the MAC address table (except broadcast/multicast packets), the traffic between two ports in the same VLAN will be two-way without restrictions.

3.4.8.1.1 Configure Port Based VLAN

Click the option **Configure VLAN** from the **Port Based VLAN** folder, and then the following screen page appears.

| Configure Port Based VLAN | | | | | | | | | | | |
|---------------------------|---|---|---|---|---|---|---|---|---|----|-----|
| Name | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | CPU |
| Default_VLAN | V | V | V | V | V | V | V | V | V | V | V |

Click **New** to add a new VLAN group and then the following screen page appears.

Use **Edit** to view and edit the current VLAN setting.

Click **Delete** to remove a VLAN group.

| Configure Port Based VLAN | | | | | | | | | | | |
|---------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|
| Current/Total/Max | 2/ 1/10 | | | | | | | | | | |
| Name | <input type="text"/> | | | | | | | | | | |
| Port Number | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | CPU |
| VLAN Members | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |

Current/Total/Max: View-only field.

Current: It shows the number of currently configured VLAN.

Total: It shows the total number of the VLANs.

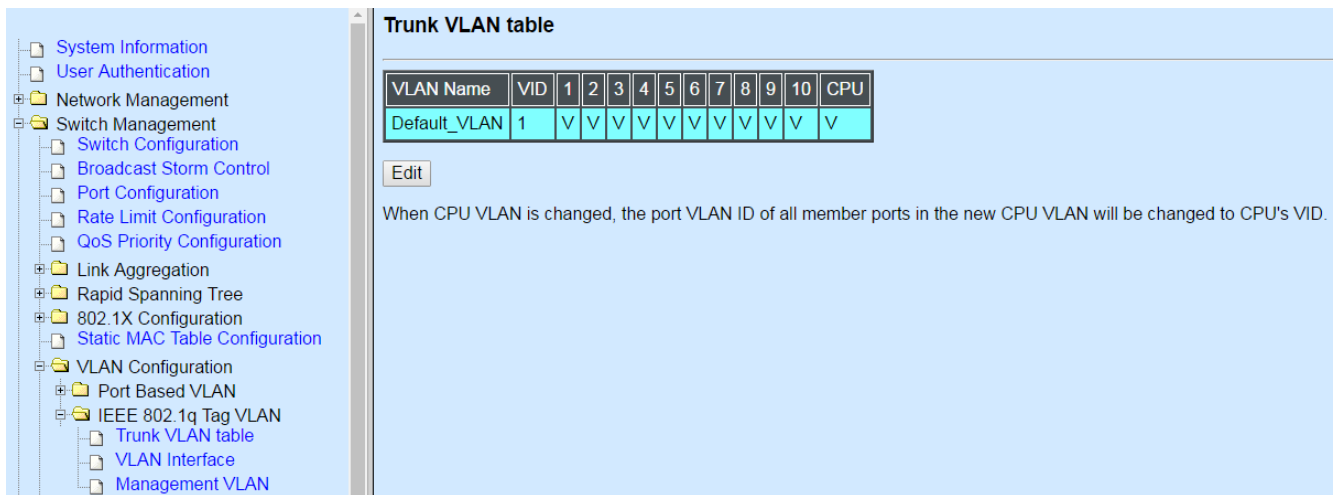

Max: It shows the maximum number available for configuration. The maximum is 10.

Name: Specify a VLAN group name, up to 15 alphanumeric characters.

Check the port number as a VLAN member and click **“OK”**

3.4.8.2 IEEE 802.1q Tag VLAN

Click the folder **IEEE 802.1Q Tag VLAN** from the **VLAN Configuration** menu and then the following screen page appears.

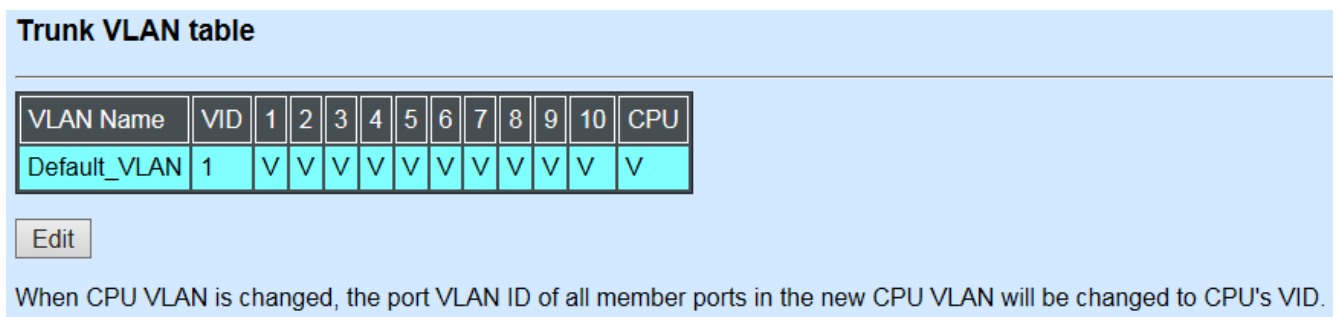

Trunk VLAN table: Edit or apply 802.1Q Tag VLAN settings.

VLAN Interface: Globally set up switch VLAN mode and per port VLAN mode.

Management VLAN: Set up management VLAN and management port(s).

3.4.8.2.1 Trunk VLAN Table

Click the option **Trunk VLAN Table** from the **IEEE 802.1q Tag VLAN** menu and then the following screen page appears.

Click **Edit** to view and edit current IEEE 802.1Q Tag VLAN setting, and then the following screen page appears.

| Configure VLAN | | | | | | | | |
|-------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| Current/Total/Max VLANs | 1/ 1/128 | | | | | | | |
| VLAN ID | 1 (1-4094) | | | | | | | |
| VLAN Name | Default_VLAN | | | | | | | |
| Port Number | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| VLAN Members | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| Port Number | 9 | | 10 | | CPU | | | |
| VLAN Members | <input checked="" type="checkbox"/> | | <input checked="" type="checkbox"/> | | <input checked="" type="checkbox"/> | | | |
| OK | | | | | | | | |

Current/Total/Max VLANs: View-only field

Current: It shows the number of currently registered VLAN.

Total: It shows the total number of registered VLANs.

Max: It shows the maximum number of available VLANs which could be registered.

VLAN ID: Display the ID for the currently registered VLAN.

VLAN Name: Specify the name for the currently registered VLAN.

VLAN Member: Check the ports to be the members of the currently registered VLAN.

Click **OK** to make the current VLAN settings effective.

3.4.8.2.2 VLAN Interface

Click the option **VLAN Interface** from the **IEEE 802.1q Tag VLAN** menu and then the following screen page appears.

VLAN Interface

802.1q Tag VLAN Mode

Port Based VLAN ▼

| Port | Mode | Access-vlan | Trunk-vlan |
|--------|----------|-------------|------------|
| Port1 | ACCESS ▼ | 1 | 1 |
| Port2 | ACCESS ▼ | 1 | 1 |
| Port3 | ACCESS ▼ | 1 | 1 |
| Port4 | ACCESS ▼ | 1 | 1 |
| Port5 | ACCESS ▼ | 1 | 1 |
| Port6 | ACCESS ▼ | 1 | 1 |
| Port7 | ACCESS ▼ | 1 | 1 |
| Port8 | ACCESS ▼ | 1 | 1 |
| Port9 | ACCESS ▼ | 1 | 1 |
| Port10 | ACCESS ▼ | 1 | 1 |

802.1q Tag VLAN Mode: Two options are available: Port Based VLAN, IEEE 802.1q VLAN.

Mode: To specify the VLAN mode for each port, there are three options available: ACCESS, TRUNK, TRUNK-NATIVE.

Access-VLAN: Specify the Access-VLAN ID (PVID) for each port. The default VLAN ID is “1”.

Trunk-VLAN: Specify the Trunk-VLAN ID (802.1q tag) for each port. Use “-” or “,” to assign multiple VIDs, for example, 1-4 and 1,2,3,4. The default VLAN ID is “1”.

Click the “**OK**” button to apply the settings.

3.4.8.2.3 Management VLAN

Click the option **Management VLAN** from the **IEEE 802.1q Tag VLAN** menu and then the following screen page appears.

Management VLAN

Management VLAN

| | |
|-------------|----------|
| CPU VLAN ID | 1 |
| VLAN Mode | Access ▼ |

Management Port

| | | | | | | | |
|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 9 | | | | 10 | | | |
| <input type="checkbox"/> | | | | <input type="checkbox"/> | | | |

OK Cancel

CPU VLAN ID: Specify the VID for CPU (management). The default VLAN ID is “1”.

VLAN Mode: Specify the VLAN mode for management VLAN. Three options are available: ACCESS, TRUNK, TRUNK-NATIVE.

Management Port: Check the port(s) as the management port(s).

Click the “**OK**” button to apply the settings

3.4.9 Mirroring Configuration

Click the option **Mirroring Configuration** from the **Switch Management** menu and then the following screen page appears.

Mirroring Configuration

| | | | | | | | | | | |
|------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|
| Mirror Mode | By Port ▼ | | | | | | | | | |
| Destination Port | Port 1 ▼ | | | | | | | | | |
| Port Number | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| Source Port | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |

OK

Mirror Mode: Either **disabled** or **By Port**.

Destination Port: Specify the port to which the traffic will be mirrored to.

Source Port: Specify the port(s) to which the traffic will be mirrored from as a source.

Click the “**OK**” button to apply the settings.

3.4.10 IGMP Snooping

IGMP, Internet Group Management Protocol, is a communications protocol used to manage the membership of Internet Protocol multicast groups. IGMP is used by IP hosts and adjacent multicast routers to establish multicast group memberships. It can be used for online streaming video and gaming, and allows more efficient use of resources when supporting these uses.

IGMP Snooping is the process of listening to IGMP traffic. IGMP snooping, as implied by the name, is a feature that allows the switch to “listen in” on the IGMP conversation between hosts and routers by processing the layer 3 packets IGMP packets sent in a multicast network.

When IGMP snooping is enabled in a switch it analyses all the IGMP packets between hosts connected to the switch and multicast routers in the network. When a switch hears an IGMP report from a host for a given multicast group, the switch adds the host’s port number to the multicast list for that group. And, when the switch hears an IGMP Leave, it removes the host’s port from the table entry.

IGMP snooping can very effectively reduce multicast traffic from streaming and other bandwidth intensive IP applications. A switch using IGMP snooping will only forward multicast traffic to the hosts interested in that traffic. This reduction of multicast traffic reduces the packet processing at the switch (at the cost of needing additional memory to handle the multicast tables) and also reduces the workload at the end hosts since their network cards (or operating system) will not have to receive and filter all the multicast traffic generated in the network.

Click the option **IGMP Snooping** from the **Management** menu and then the following screen page appears.

| IGMP Snooping | | | | | | | | |
|-----------------|--|-----------------------|--|--|--|--|--|--|
| IGMP Snooping | | Disabled ▾ | | | | | | |
| Aging Time | | 1200 1-3000(1/10 Sec) | | | | | | |
| Immediate Leave | | Disabled ▾ | | | | | | |

| | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|-------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|-------------------------------------|--------------------------|--------------------------|
| Router Port | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| | 9 | | | | 10 | | | |
| | <input type="checkbox"/> | | | | | <input type="checkbox"/> | | |

Note: Aging time setting can be changed only when IGMP immediate leave is disabled.

Note: When IGMP Immediate leave is enabled, IGMP aging time is fixed to 300 seconds.

OK

IGMP Snooping: Enable or disable IGMP Snooping.

Aging Time: Specify the IGMP querier aging time. If the switch does not receive join packets from the end device within the specified time, the entry associated with this end device will be removed from the IGMP table. The default Aging Time is 1200 (1/10 second).

Immediate Leave: Enable or disable Immediate Leave function. This works only when IGMP Snooping is enabled. When Immediate Leave is enabled, the Managed Industrial Switch removes the port immediately when it detects IGMPv1 & IGMPv2 leave message on that port.

Router Port: When ports are connected to the IGMP administrative routers, they should be checked.

Click the “**OK**” button to apply the settings.

3.4.11 LLDP Configuration

LLDP stands for Link Layer Discovery Protocol and runs over data link layer which is used for network devices to send information about themselves to other directly connected devices on the network. By using LLDP, two devices running different network layer protocols can learn information about each other. A set of attributes are used to discover neighbor devices. These attributes contains type, length, and value descriptions and are referred to TLVs. Details such as port description, system name, system description, system capabilities, management address can be sent and received on this Managed Switch. Use Spacebar to select “ON” if you want to receive and send the TLV.

Select the option **LLDP Configuration** from the **Switch Management** menu and then the following screen page appears.

LLDP Configuration

| | | | | | | | | |
|-----------------------------------|-------------------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|
| Port Number | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Port Enable | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Port Number | 9 | | | | 10 | | | |
| Port Enable | <input type="checkbox"/> | | | | <input type="checkbox"/> | | | |
| Receiver Hold-Time(TTL) | <input type="text" value="120"/> | | | | 1-3600(Second) | | | |
| Sending LLDP Packet Interval | <input type="text" value="5"/> | | | | 1-180(Second) | | | |
| Sending LLDP Packets Per Discover | <input type="text" value="1"/> | | | | 1-16(Packet) | | | |
| Selection of LLDP TLVs to send | | | | | | | | |
| Port Description | <input checked="" type="checkbox"/> | | | | | | | |
| System Name | <input checked="" type="checkbox"/> | | | | | | | |
| System Description | <input checked="" type="checkbox"/> | | | | | | | |
| System Capabilities | <input checked="" type="checkbox"/> | | | | | | | |
| Management Address | <input checked="" type="checkbox"/> | | | | | | | |

OK

Port: Check the checkbox to enable LLDP.

Receiver Hold-Time (TTL): Enter the amount of time for receiver hold-time in seconds. The Managed Switch will keep the information sent by the remote device for a period of time you specify here before discarding it.

Sending LLDP Packet Interval: Enter the time interval for updated LLDP packets to be sent.

Sending Packets Per Discover: Enter the amount of packets sent in each discover.

Delay LLDP Initialization: A period of time the Managed Switch will wait before the initial LLDP packet is sent.

Selection of LLDP TLVs to send: LLDP uses a set of attributes to discover neighbor devices. These attributes contains type, length, and value descriptions and are referred to TLVs. Details such as port description, system name, system description, system capabilities, management address can be sent from this Managed Switch.

3.4.12 Loop Detection

In a real network, it is possible the people misconnect the network cable to incur loop condition. In a worst case, the network is out of service thereafter. This section gives a guide to configure the Loop Detection function of the system to prevent the system from loop.

After a proper setting of Loop Detection function, the system detects loop condition by periodically sending loop detection packet. Once the system receives the loop detection packet from itself, it is claimed that it detects loop condition. Then, the system takes the following actions

1. It blocks the relevant port to prevent broadcast storms. In other words, the system stops forwarding all the traffic via the looped port. However, the system will process the loop detection packet received on the looped port.
2. It slowly blinks the LED of looped port in orange.
3. It periodically sends loop detection packet to detect the existence of loop condition.

When the system does not receives any loop detection packet from itself for a period of configured **Looped port unlock-interval**. The system claims the loop condition disappears. Then, the system takes the following actions

1. It un-blocks the relevant port. In other words, the system normally forwards all the traffic via the relevant port.
2. It stops slowly blinking the LED of looped port in orange.
3. It periodically sends loop detection packet to detect the existence of loop condition.

Note: Under loop condition, the LED of looped port continues to slowly blink orange even the connected network cable is unplugged out of looped port.

To set up Loop Detection function, select the option **Loop Detection Configuration** from the **Switch Management** menu and then the following screen page appears.

| Loop Detection | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|---|---|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|---|--|--|--|----|--|--|--|--------------------------|--|--|--|--------------------------|--|--|--|
| Loop Detection Enable | <input type="checkbox"/> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Detection Interval | 1 Seconds | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Looped port unlock-interval | 1 (0-1440)Minutes | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| All VLAN | <input type="checkbox"/> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Specific VLAN | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| <table border="1"> <tr> <td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td> </tr> <tr> <td><input type="checkbox"/></td><td><input type="checkbox"/></td><td><input type="checkbox"/></td><td><input type="checkbox"/></td><td><input type="checkbox"/></td><td><input type="checkbox"/></td><td><input type="checkbox"/></td><td><input type="checkbox"/></td> </tr> <tr> <td colspan="4">9</td><td colspan="4">10</td> </tr> <tr> <td colspan="4"><input type="checkbox"/></td><td colspan="4"><input type="checkbox"/></td> </tr> </table> | | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 9 | | | | 10 | | | | <input type="checkbox"/> | | | | <input type="checkbox"/> | | | |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | | | | | | | | | | | | | | | | | | | | | | | | | | |
| <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 9 | | | | 10 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| <input type="checkbox"/> | | | | <input type="checkbox"/> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| OK | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Loop Detection Enable: Check to enable the Loop Detection function on a system basis. The default setting is disabled.

Detection Interval: This is the time interval (in seconds) that the device will periodically send loop detection packets to detect the presence of looped network. The valid range is from 1 to 180 seconds. The default setting is 1 seconds.

Looped port unlock-interval: This is the time interval for the system to detect the existence of loop condition. System un-blocks the looped port if it does not receive any loop-detection packet during the configured unlock-interval. The unlock-interval can be set from 1 to 1440 minutes. The default setting is 1440 minutes.

Note:

1. Be aware that Looped port unlock-interval converted into seconds should be greater than or equal to Detection Interval seconds multiplied by 10. The '10' is a magic number which is for the system to claims the loop detection disappears when the system does not receive the loop-detection packet from itself at least 10 times. In general, it can be summarized by a formula below:

$$60 * \text{"Looped port unlock-interval"} \geq 10 * \text{"Detection Interval"}$$

2. When a port is detected as a looped port, the system keeps the looped port in blocking status until loop situation is gone. In other words, the system stops forwarding all the traffic via the looped port. However, the system will process the loop-detection packet received on the looped port.

All VLAN: Check All VLAN box to enable loop detection on all trunk-VLAN-vid configured in the **VLAN Interface** under **IEEE802.1q Tag VLAN** (Refer to Section 4.4.7.4.1)

NOTE: When All VLAN check-box is checked, it invalidates the configured “Specific VLAN”.

Specific VLAN: Set up loop detection on specified VLAN. The maximum number of VLAN ID is up to 4 sets.

NOTE: The configured “Specific VLAN” takes effect when All VLAN check-box is unchecked.

Port No.: Check to enable the Loop Detection function on the specific port(s).

NOTE: Loop Detection and RSTP (Rapid Spanning Tree Protocol) is not allowed to be enabled on the same port at the same time.

3.4.13 Ring Detection

Ring Detection used in ring topology is a helpful way of network recovery, preventing from disconnection resulting from any unexpected link down. The main advantages of Ring Detection are lower cost for cabling and installation, and high-speed recovery time.

Ring Detection

| | | | | | | | | |
|---------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|
| Enable | <input type="checkbox"/> | | | | | | | |
| According | Software ▾ | | | | | | | |
| Software Role | Slave ▾ | | | | | | | |
| Port Number | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Port Enable | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| Port Number | 9 | | | | 10 | | | |
| Port Enable | <input type="checkbox"/> | | | | <input type="checkbox"/> | | | |

OK

Enable: Check Enable box to activate Ring Detection or vice versa.

According: This is a fixed filed that Ring Detection can be configured by software only..

Role: Assign the role of the switch as either Slave or Master. Check the drop-down box to select either Master or Slave.

Master: A role posses the ability of blocking or forwarding packet.

Slave: A role posses the ability of forwarding packet only.

Port Number/Port Enable: Six ports are available at each switch. Select and check two of them for Ring Detection.

Click the “OK” button to apply the settings.

3.4.14 DHCP Snooping

Select the option **DHCP Snooping** from the **Switch Management** menu and then the following screen page appears.

DHCP Snooping

DHCP Snooping

Disabled ▾

DHCP Server Trust Port

| | | | | | | | |
|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| 9 | | | | 10 | | | |
| <input type="checkbox"/> | | | | <input type="checkbox"/> | | | |

OK

DHCP Snooping: Enable or disable DHCP Snooping function.

DHCP Server Trust Port: Specify designated port to be Trust Port that can give you “offer” from DHCP server. Check any port box to enable it.

3.5 Switch Monitor

Switch Monitor allows users to monitor the real-time operation status of the Managed Industrial Switch. Users may monitor the port link-up status or traffic counters for maintenance or diagnostic purposes. Select the folder **Switch Monitor** from the **Main Menu** and then the following screen page appears.

- System Information
- User Authentication
- Network Management
- Switch Management
 - Switch Monitor
 - Switch Port Status
 - Port Counters Rates
 - Port Counters Events
 - IEEE 802.1q Tag VLAN Table
 - LACP Monitor
 - RSTP Monitor
 - 802.1X Monitor
 - SFP Information
 - IGMP Snooping
 - MAC Address Table
 - LLDP Status
 - Loop Detection Status
 - Ring Detection Status
- System Utility

Switch Port Status

| Port | Media Type | Port State | Link State | Speed (Mbps) | Duplex | Flow Control | Description |

D :Disabled E :Enabled

- Switch Port Status:** View the port status such as media type, port state, etc.
- Port Counters Rates:** This folder includes Port Traffic Statistics (Rates), Port Packet Error Statistics (Rates), and Port Packet Analysis Statistics (Rates).
- Port Counters Events:** This folder includes Port Traffic Statistics (Events), Port Packet Error Statistics (Events), and Port Packet Analysis Statistics (Events).
- IEEE 802.1q Tag VLAN Table:** View the current IEEE 802.1q Tag VLAN Table.
- LACP Monitor:** View the LACP port status and statistics.
- RSTP Monitor:** View RSTP VLAN Bridge, Port Status, and Statistics.
- 802.1X Monitor:** View port status and Statistics.
- SFP Information:** View the current port's SFP information, e.g. Speed, Distance, Vendor Name, Vendor PN, Vendor SN, Temperature, Voltage, TX Bias, TX Power and RX Power.
- IGMP Snooping:** View a list of IGMP queries' information in VLAN(s) such as VLAN ID, Querier and reports.
- MAC Address Table:** List current MAC addresses learned by the Managed Industrial Switch.
- LLDP Status:** View the TLV information sent by the connected device with LLDP-enabled.
- Loop Detection Status:** View the Loop Detection status of each port.
- Ring Detection Status:** View the current status of Ring Detection.

3.5.1 Switch Port Status

The following screen page appears if you choose **Switch Monitor** menu and then select **Switch Port Status**.

| Switch Port Status | | | | | | | |
|--------------------|------------|------------|------------|--------------|--------|--------------|-------------|
| Port | Media Type | Port State | Link State | Speed (Mbps) | Duplex | Flow Control | Description |
| 1 | TX | E | down | -- | -- | -- | |
| 2 | TX | E | down | -- | -- | -- | |
| 3 | TX | E | down | -- | -- | -- | |
| 4 | TX | E | down | -- | -- | -- | |
| 5 | TX | E | down | -- | -- | -- | |
| 6 | TX | E | down | -- | -- | -- | |
| 7 | TX | E | down | -- | -- | -- | |
| 8 | TX | E | down | -- | -- | -- | |
| 9 | TX | E | up | 10 | half | off | |
| 10 | FX | E | down | -- | -- | -- | |

Port State

D :Disabled E :Enabled

Port: It shows the number of the port.

Media Type: It shows the media type of the port, either Copper (TX) or Fiber (FX).

Port State: It shows each port's state, either **D** (Disabled) or **E** (Enabled).

Disabled: Packets cannot be received and forwarded.

Enabled: Packets can be forwarded.

Link State: It shows the current link status of the port, either up or down.

Speed (Mbps): It shows the current operation speed of each port.

Duplex: It shows the current operation Duplex mode of each port, either Full or Half.

Flow Control: It shows the port status of Flow Control function, either on or off.

Description: It shows the description of the port described in "Port Configuration".

3.5.2 Port Counters Rates

To view the real-time statistics of the Managed Industrial Switch, click **Port counters Rates** folder from **Switch Monitor** menu and then the three options appear.

| <ul style="list-style-type: none"> System Information User Authentication Network Management Switch Management <ul style="list-style-type: none"> Switch Monitor <ul style="list-style-type: none"> Switch Port Status <ul style="list-style-type: none"> Port Counters Rates <ul style="list-style-type: none"> Port Traffic Statistics (Rates) Port Packet Error Statistics (Rates) Port Packet Analysis Statistics (Rates) Port Counters Events <ul style="list-style-type: none"> IEEE 802.1q Tag VLAN Table LACP Monitor RSTP Monitor 802.1X Monitor SFP Information | Port Traffic Statistics (Rates) | | | | | | | | |

| | 10 | 0 | 0 | 0.00% | 0 | 0 | 0.00% | 0 | 0.00% |

- 1. Port Traffic Statistics (Rates):** View the number of bytes received, frames received, bytes sent, frames sent, total bytes, etc.
- 2. Port Packet Error Statistics (Rates):** View the number of CRC errors, undersize frames, fragment frames, etc.
- 3. Port Packet Analysis Statistics (Rates):** View each port's frames analysis.

3.5.2.1 Port Traffic Statistics (Rates)

The following screen page appears if you choose **Port Counters Rates** and then select **Port Traffic Statistics (Rates)**.

| Port Traffic Statistics (Rates) | | | | | | | | |
|---------------------------------|----------------|-----------------|----------------------|------------|-------------|------------------|-------------|-------------------|
| Port | Bytes Received | Frames Received | Received Utilization | Bytes Sent | Frames Sent | Sent Utilization | Total Bytes | Total Utilization |
| 1 | 0 | 0 | 0.00% | 0 | 0 | 0.00% | 0 | 0.00% |
| 2 | 0 | 0 | 0.00% | 0 | 0 | 0.00% | 0 | 0.00% |
| 3 | 0 | 0 | 0.00% | 0 | 0 | 0.00% | 0 | 0.00% |
| 4 | 0 | 0 | 0.00% | 0 | 0 | 0.00% | 0 | 0.00% |
| 5 | 0 | 0 | 0.00% | 0 | 0 | 0.00% | 0 | 0.00% |
| 6 | 0 | 0 | 0.00% | 0 | 0 | 0.00% | 0 | 0.00% |
| 7 | 0 | 0 | 0.00% | 0 | 0 | 0.00% | 0 | 0.00% |
| 8 | 0 | 0 | 0.00% | 0 | 0 | 0.00% | 0 | 0.00% |
| 9 | 173 | 1 | 0.01% | 0 | 0 | 0.00% | 173 | 0.00% |
| 10 | 0 | 0 | 0.00% | 0 | 0 | 0.00% | 0 | 0.00% |

- Bytes Received:** The total bytes received from each port.
- Frames Received:** The total frames received from each port.
- Received Utilization:** The ratio of each port's receiving traffic to the port's current bandwidth.
- Bytes Sent:** The total bytes sent from the current port.
- Frames Sent:** The total frames sent from the current port.

Sent Utilization: The ratio of each port's sending traffic to the port's current bandwidth.

Total Bytes: The total bytes received and sent from the current port.

Total Utilization: The ratio of each port's receiving and sending traffic to the port's current bandwidth.

3.5.2.2 Port Packet Error Statistics (Rates)

The following screen page appears if you choose **Port Counters Rates** and then select **Port Packet Error Statistics (Rates)**.

| Port Packet Error Statistics (Rates) | | | | |
|--------------------------------------|--------------|--------------|--------------|--------------|
| Port | Rx CRC Error | Rx Undersize | Rx Fragments | Total Errors |
| 1 | 0 | 0 | 0 | 0 |
| 2 | 0 | 0 | 0 | 0 |
| 3 | 0 | 0 | 0 | 0 |
| 4 | 0 | 0 | 0 | 0 |
| 5 | 0 | 0 | 0 | 0 |
| 6 | 0 | 0 | 0 | 0 |
| 7 | 0 | 0 | 0 | 0 |
| 8 | 0 | 0 | 0 | 0 |
| 9 | 0 | 0 | 0 | 0 |
| 10 | 0 | 0 | 0 | 0 |

RX CRC Error: The number of packets with wrong FCS received.

RX Undersize: Undersize frames received.

RX Fragments: Fragment frames received.

Total Errors: The number of total errors.

3.5.2.3 Port Packet Analysis Statistics (Rates)

The following screen page appears if you choose **Port Counters Rates** and then select **Port Packet Analysis Statistics (Rates)**.

| Port Packet Analysis Statistics (Rates) | | | | | | | | | | |
|---|--------------------|------------------------|-------------------------|-------------------------|--------------------------|----------------------------|---------------------|---------------------|---------------------|---------------------|
| Port | Rx Frames 64 Bytes | Rx Frames 65-127 Bytes | Rx Frames 128-255 Bytes | Rx Frames 256-511 Bytes | Rx Frames 512-1023 Bytes | Rx Frames 1024-10240 Bytes | Rx Multicast Frames | Tx Multicast Frames | Rx Broadcast Frames | Tx Broadcast Frames |
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 3 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 6 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 7 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 8 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 9 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 10 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

RX Frames 64 Bytes: 64 bytes frames received.

RX Frames 65-127 Bytes: 65-127 bytes frames received.

RX Frames 128-255 Bytes: 128-255 bytes frames received.

RX Frames 256-511 Bytes: 256-511 bytes frames received.

RX Frames 512-1023 Bytes: 512-1023 bytes frames received.

RX Frames 1024-10240 Bytes: 1024-10240 bytes frames received.

RX Multicast Frames: Good multicast frames received.

TX Multicast Frames: Good multicast packets sent.

RX Broadcast Frames: Good broadcast frames received.

TX Broadcast Frames: Good broadcast packets sent.

3.5.3 Port Counters Events

To view the accumulated statistics of the Managed Industrial Switch, click **Port counters Events** folder and then three options appear. The event mode of port counters will be re-calculated when that counter is reset or cleared.

- System Information
- User Authentication
- Network Management
- Switch Management
- Switch Monitor
 - Switch Port Status
 - Port Counters Rates
 - Port Counters Events
 - Port Traffic Statistics (Events)
 - Port Packet Error Statistics (Events)
 - Port Packet Analysis Statistics (Events)
 - IEEE 802.1q Tag VLAN Table
- RSTP Monitor
- SFP Information
 - IGMP Snooping
 - MAC Address Table
 - Ring Detection Status
- System Utility
 - Save Configuration
 - Reset System
 - Logout

Port Traffic Statistics (Events)

| Port | Bytes Received | Frames Received | Bytes Sent | Frames Sent | Total Bytes |
|------|----------------|-----------------|------------|-------------|-------------|
| 1 | 296933 | 3215 | 87487 | 196 | 384420 |
| 2 | 0 | 0 | 0 | 0 | 0 |
| 3 | 0 | 0 | 0 | 0 | 0 |
| 4 | 0 | 0 | 0 | 0 | 0 |
| 5 | 0 | 0 | 0 | 0 | 0 |
| 6 | 0 | 0 | 0 | 0 | 0 |
| 7 | 0 | 0 | 0 | 0 | 0 |
| 8 | 0 | 0 | 0 | 0 | 0 |
| 9 | 0 | 0 | 0 | 0 | 0 |
| 10 | 0 | 0 | 0 | 0 | 0 |

Clear All

- Port Traffic Statistics (Events):** View the number of bytes received, frames received, bytes sent, frames sent, and total bytes.
- Port Packet Error Statistics (Events):** View the number of CRC errors, undersize frames, fragment frames, etc.
- Port Packet Analysis Statistics (Events):** View each port's frame analysis.

3.5.3.1 Port Traffic Statistics (Events)

The following screen page appears if you choose **Port Counters Events** and then select **Port Traffic Statistics (Events)**.

| Port Traffic Statistics (Events) | | | | | |
|----------------------------------|----------------|-----------------|------------|-------------|-------------|
| Port | Bytes Received | Frames Received | Bytes Sent | Frames Sent | Total Bytes |
| 1 | 0 | 0 | 0 | 0 | 0 |
| 2 | 0 | 0 | 0 | 0 | 0 |
| 3 | 0 | 0 | 0 | 0 | 0 |
| 4 | 0 | 0 | 0 | 0 | 0 |
| 5 | 0 | 0 | 0 | 0 | 0 |
| 6 | 0 | 0 | 0 | 0 | 0 |
| 7 | 0 | 0 | 0 | 0 | 0 |
| 8 | 0 | 0 | 0 | 0 | 0 |
| 9 | 431065 | 4785 | 237425 | 501 | 668490 |
| 10 | 0 | 0 | 0 | 0 | 0 |

Clear All

Bytes Received: The total bytes received from each port.

Frames Received: The total frames received from each port.

Bytes Sent: The total bytes sent from each port.

Frames Sent: The total frames sent from each port.

Total Bytes: The total bytes received and sent from each port.

Clear All: Click “**Clear All**” button to clear all ports’ statistics.

3.5.3.2 Port Packet Error Statistics (Events)

The following screen page appears if you choose **Port Counters Events** and then select **Port Packet Error Statistics (Events)**.

| Port Packet Error Statistics (Events) | | | | |
|---------------------------------------|--------------|--------------|--------------|--------------|
| Port | Rx CRC Error | Rx Undersize | Rx Fragments | Total Errors |
| 1 | 0 | 0 | 0 | 0 |
| 2 | 0 | 0 | 0 | 0 |
| 3 | 0 | 0 | 0 | 0 |
| 4 | 0 | 0 | 0 | 0 |
| 5 | 0 | 0 | 0 | 0 |
| 6 | 0 | 0 | 0 | 0 |
| 7 | 0 | 0 | 0 | 0 |
| 8 | 0 | 0 | 0 | 0 |
| 9 | 0 | 0 | 12 | 24 |
| 10 | 0 | 0 | 0 | 0 |

Clear All

RX CRC Error: The number of packets with wrong FCS received.

RX Undersize: Undersize frames received.

RX Fragments: Fragment frames received.

Total Errors: The number of total errors.

Clear All: Click “**Clear All**” button to clear all ports’ statistics.

3.5.3.3 Port Packet Analysis Statistics (Events)

The following screen page appears if you choose **Port Counters Events** and then select **Port Packet Analysis Statistics (Events)**.

Port Packet Analysis Statistics (Events)

| Port | Rx Frames 64 Bytes | Rx Frames 65-127 Bytes | Rx Frames 128-255 Bytes | Rx Frames 256-511 Bytes | Rx Frames 512-1023 Bytes | Rx Frames 1024-10240 Bytes | Rx Multicast Frames | Tx Multicast Frames | Rx Broadcast Frames | Tx Broadcast Frames |
|------|--------------------|------------------------|-------------------------|-------------------------|--------------------------|----------------------------|---------------------|---------------------|---------------------|---------------------|
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 3 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 6 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Clear All

RX Frames 64 Bytes: 64 bytes frames received.

RX Frames 65-127 Bytes: 65-127 bytes frames received.

RX Frames 128-255 Bytes: 128-255 bytes frames received.

RX Frames 256-511 Bytes: 256-511 bytes frames received.

RX Frames 512-1023 Bytes: 512-1023 bytes frames received.

RX Frames 1024-10240 Bytes: 1024-10240 bytes frames received.

RX Multicast Frames: Good multicast frames received.

TX Multicast Frames: Good multicast packets sent.

RX Broadcast Frames: Good broadcast frames received.

TX Broadcast Frames: Good broadcast packets sent.

Clear All: Click “**Clear All**” button to clear all ports’ statistics.

3.5.4 IEEE 802.1q Tag VLAN Table

Select **IEEE 802.1q Tag VLAN Table** from the **Switch Monitor** menu and then the following screen page appears.

IEEE 802.1q Tag VLAN Table

| VLAN Name | VID | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | CPU |
|--------------|-----|---|---|---|---|---|---|---|---|---|----|-----|
| Default_VLAN | 1 | - | - | - | - | - | V | V | V | V | V | V |
| Access-0010 | 10 | V | V | V | - | - | - | - | - | - | - | - |
| Access-0100 | 100 | - | - | - | V | V | - | - | - | - | - | - |

VLAN Name: View-only filed that shows the VLAN group name.

VID: View-only filed that shows the VID.

3.5.5 LACP Monitor

Click the **LACP Monitor** folder and then the two options will appears.

- System Information
- User Authentication
- Network Management
- Switch Management
- Switch Monitor
 - Switch Port Status
 - Port Counters Rates
 - Port Counters Events
 - IEEE 802.1q Tag VLAN Table
 - LACP Monitor
 - LACP Port Status
 - LACP Statistics
 - RSTP Monitor
 - 802.1X Monitor
 - SFP Information
 - IGMP Snooping
 - MAC Address Table

LACP Port Status

| Port | LACP Operational State | Key | Aggr ID | Partner ID | Partner Port |
|------|------------------------|-----|---------|-------------------|--------------|
| 1 | down | 1 | 01 | 00:00:00:00:00:00 | 0 |
| 2 | down | 1 | 02 | 00:00:00:00:00:00 | 0 |
| 3 | down | 1 | 03 | 00:00:00:00:00:00 | 0 |
| 4 | down | 1 | 04 | 00:00:00:00:00:00 | 0 |
| 5 | down | 1 | 05 | 00:00:00:00:00:00 | 0 |
| 6 | down | 1 | 06 | 00:00:00:00:00:00 | 0 |
| 7 | down | 1 | 07 | 00:00:00:00:00:00 | 0 |
| 8 | down | 1 | 08 | 00:00:00:00:00:00 | 0 |
| 9 | down | 1 | 09 | 00:00:00:00:00:00 | 0 |
| 10 | down | 1 | 10 | 00:00:00:00:00:00 | 0 |

3.5.5.1 LACP Port Status

LACP Port Status allows users to view a list of all LACP ports' information. Select **LACP Port Status** from the **LACP monitor** menu and then the following screen page appears.

LACP Port Status

| Port | LACP Operational State | Key | Aggr ID | Partner ID | Partner Port |
|------|------------------------|-----|---------|-------------------|--------------|
| 1 | down | 1 | 01 | 00:00:00:00:00:00 | 0 |
| 2 | down | 1 | 02 | 00:00:00:00:00:00 | 0 |
| 3 | down | 1 | 03 | 00:00:00:00:00:00 | 0 |
| 4 | down | 1 | 04 | 00:00:00:00:00:00 | 0 |
| 5 | down | 1 | 05 | 00:00:00:00:00:00 | 0 |
| 6 | down | 1 | 06 | 00:00:00:00:00:00 | 0 |
| 7 | down | 1 | 07 | 00:00:00:00:00:00 | 0 |
| 8 | down | 1 | 08 | 00:00:00:00:00:00 | 0 |
| 9 | down | 1 | 09 | 00:00:00:00:00:00 | 0 |
| 10 | down | 1 | 10 | 00:00:00:00:00:00 | 0 |

In this page, you can find the following information about LACP port status:

Port Number: The number of the port.

LACP Operational State: Current operational state of LACP

Key: The current operational key for the LACP group.

Aggr ID: The ID of the LACP group.

In LACP mode, link aggregation control protocol data unit (LACPDU) is used for exchanging information among LACP-enabled devices. After LACP is enabled on a port, the port sends LACPDU to notify the remote system of its system LACP priority, system MAC address, port LACP priority, port number and operational key. Upon receipt of an LACPDU, the remote system compares the received information with the information received on other ports to determine the ports that can operate as selected ports. This allows the two systems to reach an agreement on the states of the related ports when aggregating ports, link aggregation control automatically assigns each port an operational key based on its rate, duplex mode and other basic configurations. In an LACP aggregation group, all ports share the same operational key; in a manual or static LACP aggregation, the selected ports share the same operational key.

Partner ID: The ID (MAC address) of the partner port

Partner Port: The corresponding port numbers that connect to the partner switch in LACP mode.

3.5.5.2 LACP Statistics

In order to view the real-time LACP statistics status of the Managed Switch, select **LACP Statistics** from the **LACP Monitor** menu and then the following screen page appears.

| LACP Statistics | | | | | |
|-----------------|------------------|---------------|------------------|------------------|----------------|
| Clear All | | | | | |
| Port | LACP Transmitted | LACP Received | Illegal Received | Unknown Received | Clear Counters |
| 1 | 0 | 0 | 0 | 0 | Clear |
| 2 | 0 | 0 | 0 | 0 | Clear |
| 3 | 0 | 0 | 0 | 0 | Clear |
| 4 | 0 | 0 | 0 | 0 | Clear |
| 5 | 0 | 0 | 0 | 0 | Clear |
| 6 | 0 | 0 | 0 | 0 | Clear |
| 7 | 0 | 0 | 0 | 0 | Clear |
| 8 | 0 | 0 | 0 | 0 | Clear |
| 9 | 0 | 0 | 0 | 0 | Clear |
| 10 | 0 | 0 | 0 | 0 | Clear |

Port: LACP packets (LACPDU) transmitted or received from current port.

LACP Transmitted: Packets transmitted from current port.

LACP Received: Packets received from current port.

Illegal Received: Illegal packets received from current port.

Unknown Received: Unknown packets received from current port.

Clear Counter: Clear the statistics of the current port.

3.5.6 RSTP Monitor

Click the **RSTP Monitor** folder and then three options appear.

| | | | | | | | |
|--|-----------------------------|---------|------------|-----------|----------|-------------------------|-----------|
| <ul style="list-style-type: none"> System Information User Authentication Network Management Switch Management Switch Monitor <ul style="list-style-type: none"> Switch Port Status Port Counters Rates Port Counters Events IEEE 802.1q Tag VLAN Table LACP Monitor RSTP Monitor <ul style="list-style-type: none"> RSTP Bridge Overview RSTP Port Status RSTP Statistics | RSTP Bridge Overview | | | | | | |
| | Update | | | | | | |
| | Bridge ID | Max Age | Hello Time | Fwd Delay | Topology | Root ID | Root Port |
| | 4097:00-06-19-22-76-44 | 20 | 2 | 15 | Steady | 32769:00-06-19-22-76-44 | 0 |

3.5.6.1 RSTP Bridge Overview

RSTP Bridge Overview allows users to view a list of all RSTP VLANs' brief information, such as Bridge ID, topology status and Root ID. Select **RSTP Bridge Overview** from the **RSTP Monitor** menu and then the following screen page appears.

| | | | | | | |
|-----------------------------|---------|------------|-----------|----------|-------------------------|-----------|
| RSTP Bridge Overview | | | | | | |
| Update | | | | | | |
| Bridge ID | Max Age | Hello Time | Fwd Delay | Topology | Root ID | Root Port |
| 32769:00-06-19-0e-f0-36 | 20 | 2 | 15 | Steady | 32769:00-06-19-0e-f0-36 | 0 |

In this page, you can find the following information about RSTP bridge:

Update: Update the current status.

Bridge ID: RSTP Bridge ID of the Managed Switch

Max Age: Max Age setting of the Managed Switch.

Hello Time: Hello Time setting of the Managed Switch.

Forward Delay: The Managed Switch's setting of Forward Delay Time.

Topology: The state of the topology.

Root ID: Display this Managed Switch's Root ID.

Root port: Display this Managed Switch's Root Port Number.

3.5.6.2 RSTP Port Status

RSTP Port Status allows users to view a list of all RSTP ports' information. Select **RSTP Port Status** from the **RSTP Monitor** menu and then the following screen page appears.

RSTP Port Status

| Port | Path Cost | Edge Port | P2p Port | Protocol | Role | Port State |
|-------|-----------|-----------|----------|----------|---------|------------|
| 1 | 0 | no | yes | RSTP | Non-STP | Non-STP |
| 2 | 0 | no | yes | RSTP | Non-STP | Non-STP |
| 3 | 0 | no | yes | RSTP | Non-STP | Non-STP |
| 4 | 0 | no | yes | RSTP | Non-STP | Non-STP |
| 5 | 0 | no | yes | RSTP | Non-STP | Non-STP |
| 6 | 0 | no | yes | RSTP | Non-STP | Non-STP |
| 7 | 0 | no | yes | RSTP | Non-STP | Non-STP |
| 8 | 0 | no | yes | RSTP | Non-STP | Non-STP |
| 9 | 0 | no | yes | RSTP | Non-STP | Non-STP |
| 10 | 0 | no | yes | RSTP | Non-STP | Non-STP |
| LLAG1 | 0 | no | no | RSTP | Non-STP | Non-STP |
| LLAG2 | 0 | no | no | RSTP | Non-STP | Non-STP |
| LLAG3 | 0 | no | no | RSTP | Non-STP | Non-STP |
| LLAG4 | 0 | no | no | RSTP | Non-STP | Non-STP |
| LLAG5 | 0 | no | no | RSTP | Non-STP | Non-STP |

In this page, you can find the following information about RSTP status:

Port Number: The number of the port.

Path Cost: The Path Cost of the port.

Edge Port: “Yes” is displayed if the port is the Edge port connecting to an end station and does not receive BPDU.

P2p Port: “Yes” is displayed if the port link is connected to another STP device.

Protocol: Display RSTP or STP.

Role: Display the Role of the port (non-STP, forwarding or blocked).

Port State: Display the state of the port (non-STP, forwarding or blocked).

3.5.6.3 RSTP Statistics

In order to view the real-time RSTP statistics status of the Managed Switch, select **RSTP Statistics** from the **RSTP Monitor** menu and then the following screen page appears.

| RSTP Statistics | | | | | | | | |
|-----------------|------------------|-----------------|-----------------|---------------|--------------|--------------|------------------|------------------|
| Port | RSTP Transmitted | STP Transmitted | TCN Transmitted | RSTP Received | STP Received | TCN Received | Illegal Received | Unknown Received |
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 3 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 6 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 7 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 8 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 9 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 10 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| LLAG1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| LLAG2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| LLAG3 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| LLAG4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| LLAG5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Port Number: The number of the port.

RSTP Transmitted: The total transmitted RSTP packets from current port.

STP Transmitted: The total transmitted STP packets from current port.

TCN Transmitted: The total transmitted TCN (Topology Change Notification) packets from current port.

RSTP Received: The total received RSTP packets from current port.

STP Received: The total received STP packets from current port.

TCN Received: The total received TCN packets from current port.

Illegal Received: The total received illegal packets from current port.

Unknown Received: The total received unknown packets from current port.

3.5.7 802.1X Monitor

Click the **802.1X Monitor** folder and then two options appear.

- System Information
- User Authentication
- Network Management
- Switch Management
- Switch Monitor
 - Switch Port Status
 - Port Counters Rates
 - Port Counters Events
 - IEEE 802.1q Tag VLAN Table
 - LACP Monitor
 - RSTP Monitor
 - 802.1X Monitor
 - 802.1X Port Status
 - 802.1X Statistics
 - SFP Information
 - IGMP Snooping
 - MAC Address Table

802.1X Port Status

| Port | State | Last Source | Last ID |
|------|----------|-------------|---------|
| 1 | Disabled | | |
| 2 | Disabled | | |
| 3 | Disabled | | |
| 4 | Disabled | | |
| 5 | Disabled | | |
| 6 | Disabled | | |
| 7 | Disabled | | |
| 8 | Disabled | | |
| 9 | Disabled | | |
| 10 | Disabled | | |

3.5.7.1 802.1X Port Status

802.1X Port Status allows users to view a list of all 802.1x ports' information. Select **802.1X port status** from the **802.1x Monitor** menu and then the following screen page appears.

802.1X Port Status

| Port | State | Last Source | Last ID |
|------|----------|-------------|---------|
| 1 | Disabled | | |
| 2 | Disabled | | |
| 3 | Disabled | | |
| 4 | Disabled | | |
| 5 | Disabled | | |
| 6 | Disabled | | |
| 7 | Disabled | | |
| 8 | Disabled | | |
| 9 | Disabled | | |
| 10 | Disabled | | |

In this page, you can find the following information about 802.1X ports:

Port: The number of the port.

State: Display the number of the port 802.1x link state LinkDown or LinkUp.

Last Source: Display the number of the port's Last Source.

Last ID: Display the number of the port's Last ID.

3.5.7.2 802.1X Statistics

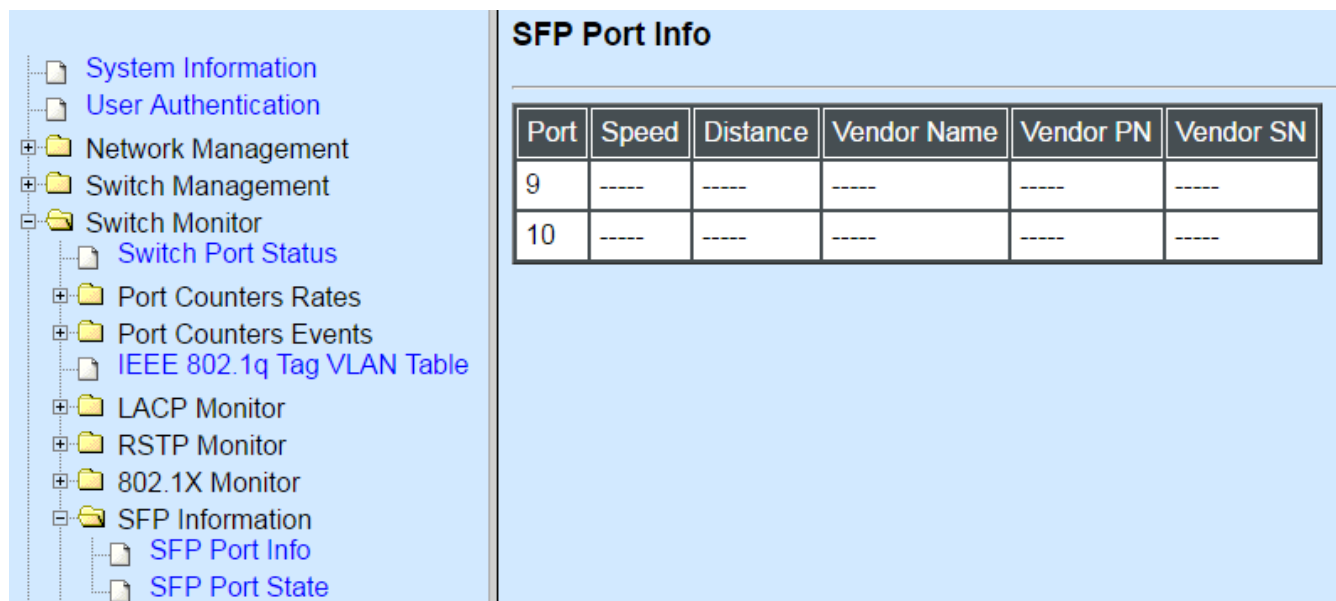

In order to view the real-time 802.1X port statistics status of the Managed Switch, select **802.1x Statistics** from the **802.1x Monitor** menu and then the following screen page shows up.

802.1X Statistics

| Port | Rx Total | Rx Response ID | Rx Response | Rx Start | Rx Logoff | Rx Invalid Type | Rx Invalid Length | Rx Access Challenges | Rx Other Requests | Rx Auth. Successes | Rx Auth. Failures | Tx Total | Tx Request ID | Tx Request | Tx Responses |
|------|----------|----------------|-------------|----------|-----------|-----------------|-------------------|----------------------|-------------------|--------------------|-------------------|----------|---------------|------------|--------------|
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 3 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 6 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

3.5.8 SFP Information

Click **SFP Information** folder from **Switch Monitor** menu and then two options appear.

The screenshot shows a web interface with a left-hand navigation tree and a main content area. The tree includes folders like System Information, User Authentication, Network Management, Switch Management, and Switch Monitor. Under Switch Monitor, there is an SFP Information folder which is expanded to show SFP Port Info and SFP Port State. The main content area is titled 'SFP Port Info' and contains a table with the following data:

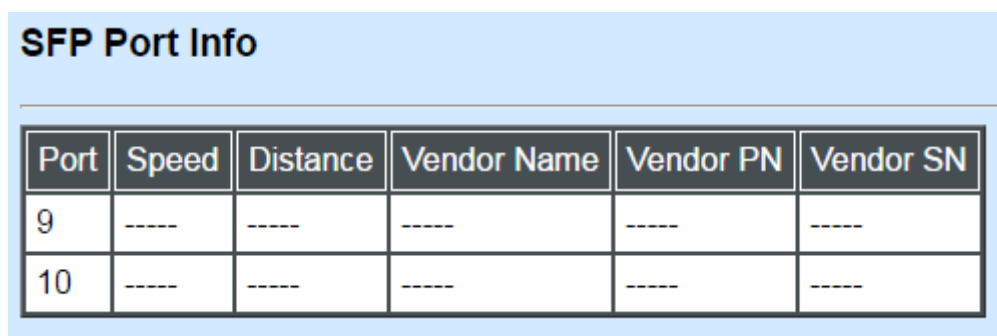

| Port | Speed | Distance | Vendor Name | Vendor PN | Vendor SN |
|------|-------|----------|-------------|-----------|-----------|
| 9 | ---- | ---- | ---- | ---- | ---- |
| 10 | ---- | ---- | ---- | ---- | ---- |

SFP Port Info: It shows the information of Speed, Distance, Vendor Name, Vendor PN, and Vendor SN of the SFP Port.

SFP Port State: It shows the state of Temperature, Voltage, TX Bias, TX Power, and RX Power of the SFP Port.

3.5.8.1 SFP Port Info

The following screen page appears if you choose **SFP Information** and then select **SFP Port Info**.

The screenshot shows a web interface with a light blue header titled 'SFP Port Info'. Below the header is a table with the following data:

| Port | Speed | Distance | Vendor Name | Vendor PN | Vendor SN |
|------|-------|----------|-------------|-----------|-----------|
| 9 | ---- | ---- | ---- | ---- | ---- |
| 10 | ---- | ---- | ---- | ---- | ---- |

Port: The port number of the slide-in SFP module.

Speed: The transmitting speed of the slide-in SFP module.

Distance: The transmitting distance of the slide-in SFP module.

Vendor Name: The vendor name of the slide-in SFP module.

Vendor PN: The vendor part number of the slide-in SFP module.

Vendor SN: The vendor serial number of the slide-in SFP module.

3.5.8.2 SFP Port State

The following screen page appears if you choose **SFP Information** and then select **SFP Port State**.

| SFP Port State | | | | | |
|----------------|----------------|------------|-------------|---------------|---------------|
| Port | Temperature(C) | Voltage(V) | TX Bias(mA) | TX Power(dbm) | RX Power(dbm) |
| 9 | ---- | ---- | ---- | ---- | ---- |
| 10 | ---- | ---- | ---- | ---- | ---- |

Port: The port number of the slide-in SFP module.

Temperature (C): The operation temperature of the slide-in SFP module.

Voltage (V): The operation voltage of the slide-in SFP module.

TX Bias (mA): The operation current of the slide-in SFP module.

TX Power (dbm): The optical transmission power of the slide-in SFP module.

RX Power (dbm): The optical receiver power of the slide-in SFP module.

3.5.9 IGMP Snooping

The following screen page appears if you choose **Switch Monitor** and then select **IGMP Snooping**.

IGMP Snooping

Update

VLAN ID

Group

Port

VLAN ID: This shows the multicast IP address of IGMP querier.

Group: The VID of the specific multicast group.

Port: The port(s) grouped in the specific multicast group.

Click **Update** to update the IGMP Table.

3.5.10 MAC Address Table

MAC Address Table displays MAC addresses learned after the system reset.

MAC Address Table

All

Top

Next

| Total | 1 | | | | |
|-------|---------|-------------------|-----|--------|-------|
| Index | Type | MAC Address | VID | LAG_ID | Ports |
| 1 | dynamic | 00:06:19:00:01:00 | 1 | -- | CPU |

Note: This page is the end of the MAC Table page please press the Top or Next button for update MAC Table!

The table above shows the MAC addresses learned from each port of the Managed Industrial Switch.

Click **Top** to show the first page (the first twenty entries) of the MAC Address Table.

Click **Next** to show the next page of the MAC Address Table.

3.5.11 LLDP Status

Select **LLDP Status** from the **Switch Monitor** menu and then the following screen page

appears.

| LLDP Status | | | | | | | | | | |
|---------------------------------------|------------|-------------|-------------|------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|
| <input type="button" value="Update"/> | | | | | | | | | | |
| Local Port | Chassis ID | Remote Port | System Name | Port Description | System Capabilities | Management1 Address | Management2 Address | Management3 Address | Management4 Address | Management5 Address |
| 1 | | | | | | | | | | |
| 2 | | | | | | | | | | |
| 3 | | | | | | | | | | |
| 4 | | | | | | | | | | |
| 5 | | | | | | | | | | |
| 6 | | | | | | | | | | |
| 7 | | | | | | | | | | |
| 8 | | | | | | | | | | |
| 9 | | | | | | | | | | |
| 10 | | | | | | | | | | |

Click “**Update**” to refresh LLDP Status table.

Local Port: View-only field that shows the port number on which LLDP frames are received.

Chassis ID: View-only field that shows the MAC address of the LLDP frames received (the MAC address of the neighboring device).

Remote Port: View-only field that shows the port number of the neighboring device.

System Name: View-only field that shows the system name advertised by the neighboring device.

Port Description: View-only field that shows the port description of the remote port.

System Capabilities: View-only field that shows the capability of the neighboring device.

Management Address (1~5): View-only field that shows the IP address (1~5) of the neighboring device.

3.5.12 Loop Detection Status

The following screen page appears if you choose **Switch Monitor** and then select **Loop Detection Status**.

| Loop Detection Status | | |
|-----------------------|---------|------------|
| Port | Status | Lock Cause |
| 1 | Un-lock | |
| 2 | Un-lock | |
| 3 | Un-lock | |
| 4 | Un-lock | |
| 5 | Un-lock | |
| 6 | Un-lock | |
| 7 | Un-lock | |
| 8 | Un-lock | |
| 9 | Un-lock | |
| 10 | Un-lock | |

Status: This shows the status of the port, **Lock** or **Un-lock**.

Lock Cause: This shows the factor that causes the port to be locked.

3.5.13 Ring Detection Status

Ring Status

Ring Detection is disabled.

Software Role is Slave

Update

| Port Number | Port Enable | Port State |
|-------------|-------------|------------|
| 1 | Disable | |
| 2 | Disable | |
| 3 | Disable | |
| 4 | Disable | |
| 5 | Disable | |
| 6 | Disable | |
| 7 | Disable | |
| 8 | Disable | |
| 9 | Enable | Forwarding |
| 10 | Enable | Forwarding |

Port Enable: The status of whether Ring Detection on ports is enabled or disabled.

Port State: The status of whether the port is blocking or forwarding.

Blocking: It indicates a port is temporarily blocked and stop sending packet until link down occurs.

Forwarding: It indicates a port keeps sending packets.

3.6 System Utility

Select the folder **System Utility** from the left column and then the following screen page appears.

IPS-3110

- System Information
- User Authentication
- Network Management
- Switch Management
- Switch Monitor
- System Utility
 - Event Log**
 - HTTP Upgrade
 - FTP/TFTP Upgrade
 - Load Factory Settings
 - Load Factory Settings Ex
 - Save Configuration
 - Reset System
 - Logout

Event Log

| Index | Type | Time | Up Time | Description | Source | Event | Name/Community | Address |
|-------|------|------|----------------|--------------------------------|--------|-------|----------------|-------------|
| 1 | I | | 0 day 00:00:46 | User from web login succeeded. | web | login | admin | 192.168.0.3 |
| 2 | I | | 0 day 00:47:41 | User from web login succeeded. | web | login | admin | 192.168.0.3 |
| 3 | I | | 0 day 01:38:12 | User from web login succeeded. | web | login | admin | 192.168.0.3 |
| 4 | I | | 0 day 04:22:46 | User from web login succeeded. | web | login | admin | 192.168.0.3 |

Clear All

- Event Log:** Event log can keep a record of system's log events such as system warm start, cold start, link up/down, user login/logout, etc.
- HTTP Upgrade:** Users may save or restore the configuration and update the firmware by HTTP.
- FTP/TFTP Upgrade:** The Managed Industrial Switch has both built-in TFTP and FTP clients. Users may save or restore the configuration and update the firmware by FTP/TFTP.
- Load Factory Settings:** Load Factory Setting will set the configuration of the Managed Industrial Switch back to the factory default settings. The IP and Gateway addresses will be set to the factory default as well.
- Load Factory Settings Except Network Configuration:** Selecting this function will also restore the configuration of the Managed Industrial Switch to its original factory default settings. However, this will not reset the IP and Gateway addresses to the factory default.

3.6.1 Event Log

Event Log keeps a record of user login and logout timestamp information. Select **Event Log** from the **System Utility** menu and then the following screen page appears.

Event Log

| Index | Type | Time | Up Time | Description | Source | Event | Name/Community | Address |
|-------|------|------|----------------|--------------------------------|--------|-------|----------------|-------------|
| 1 | I | | 0 day 00:00:46 | User from web login succeeded. | web | login | admin | 192.168.0.3 |
| 2 | I | | 0 day 00:47:41 | User from web login succeeded. | web | login | admin | 192.168.0.3 |
| 3 | I | | 0 day 01:38:12 | User from web login succeeded. | web | login | admin | 192.168.0.3 |
| 4 | I | | 0 day 04:22:46 | User from web login succeeded. | web | login | admin | 192.168.0.3 |

Clear All

Click **Clear All** to clear all Event Log records.

3.6.2 HTTP Upgrade

Click the option **HTTP Upgrade** from the **System Utility** menu and then the following screen page appears.

The screenshot displays the 'HTTP Upgrade' web interface. It features two main sections: 'Configuration Update' and 'Firmware Update'. The 'Configuration Update' section includes a 'Backup' tab with a 'Config Type' dropdown set to 'Running-config' and a 'Backup' button, and a 'Restore' tab with a file selection field, a 'Browse..' button, and a 'Restore' button. The 'Firmware Update' section includes an 'Upgrade Image Option' dropdown set to 'Image1' and a 'Select File' section with a file selection field, a 'Browse..' button, and an 'Upload' button.

| HTTP Upgrade | |
|--------------------------------|--|
| Configuration Update | |
| Backup | Config Type: Running-config ▼ |
| | device configuration to local file: Backup |
| Restore | File selection: Browse.. Restore |
| Firmware Update | |
| Upgrade Image Option: Image1 ▼ | |
| Select File | File selection: Browse.. Upload |

Configuration Update

Config Type: There are three configuration types: Running-config, Default-config and Start-up-config

Running-config: Back up the configuration you're processing.

Default-config: Back up the factory setting.

Start-up-config: Back up the last saved configuration.

Device Configuration to Local File: Click **Backup** and define the route where you intend to save the configuration.

Restore: Click **Browse**, select the designated file and then click **Restore**.

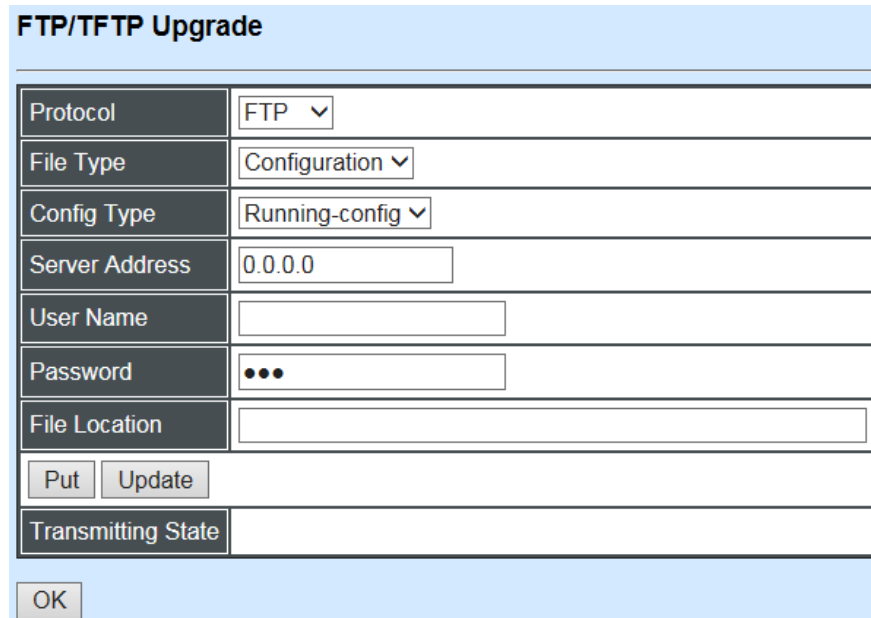

Firmware Update

Upgrade Image Option: Choose the image you want to upgrade.

Select File: Click **Browse**, select the designated file and then click **Upload**.

3.6.3 FTP/TFTP Upgrade

Click the option **FTP/TFTP Upgrade** from the **System Utility** menu and then the following screen page appears.

The screenshot shows a web-based configuration window titled "FTP/TFTP Upgrade". It contains several input fields and buttons. The "Protocol" field is a dropdown menu set to "FTP". The "File Type" field is a dropdown menu set to "Configuration". The "Config Type" field is a dropdown menu set to "Running-config". The "Server Address" field is a text box containing "0.0.0.0". The "User Name" field is an empty text box. The "Password" field is a text box with three dots, indicating a masked password. The "File Location" field is an empty text box. Below these fields are two buttons: "Put" and "Update". At the bottom of the form is a "Transmitting State" field, which is currently empty. Below the form is an "OK" button.

| | |
|--|------------------|
| Protocol | FTP ▾ |
| File Type | Configuration ▾ |
| Config Type | Running-config ▾ |
| Server Address | 0.0.0.0 |
| User Name | |
| Password | ••• |
| File Location | |
| <input type="button" value="Put"/> <input type="button" value="Update"/> | |
| Transmitting State | |

Protocol: Select the preferred protocol, either FTP or TFTP.

File Type: Select the file type to process, either Configuration or Firmware.

Config Type: Three options for Config Type are available while the File Type is Configuration: Running-config, Default-config and Start-up-config.

Upgrade Image Option: While the File Type is Firmware, select Image1 or Image2 to update the firmware.

Server Address: Enter the specific IP address of the File Server.

User Name: Enter the specific username to access the File Server. (Leave it blank while using TFTP)

Password: Enter the specific password to access the File Server. (Leave it blank while using TFTP)

File Location: Enter the specific path and filename within the File Server.

Put: Click **Put** to start the upload procedure and transmit the file to the server.

Update: Click **Update** to instruct the Managed Industrial Switch to update the firmware or configuration from the File Server. After a successful update, a message will pop up. The Managed Industrial Switch will need a reset to make changes effective.

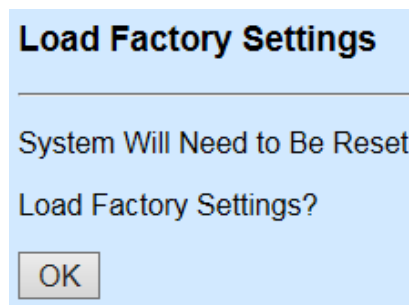

Transmitting State: This field displays the uploading or updating status.

OK: Click **OK** to update the firmware or configuration from the File Server.

3.6.4 Load Factory Settings

Load Factory Settings will set all configurations of the Managed Industrial Switch back to the factory default settings, including the IP and Gateway address. This function is useful when network administrators would like to re-configure the system. A system reset is required to make all changes effective after Load Factory Settings.

Select **Load Factory Settings** from the **System Utility** menu and then the following screen page appears.

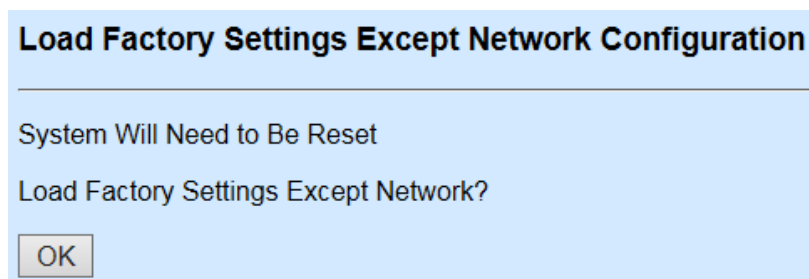

Click the “**OK**” button to restore the Managed Industrial Switch back to the defaults.

3.6.5 Load Factory Settings Except Network Configuration

Load Factory Settings Except Network Configuration will set all configurations of the Managed Industrial Switch back to the factory default settings. However, IP and Gateway addresses will not restore to the factory default. **Load Factory Settings Except Network Configuration** is very useful when network administrators need to re-configure the system “REMOTELY”, because conventional Factory Reset will bring network settings back to default and lose all remote network connections.

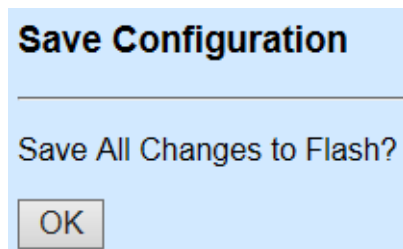

Select **Load Factory Setting Except Network Configuration** from the **System Utility** menu, then the following screen page shows up.

Click the “**OK**” button to restore the Managed Industrial Switch back to the defaults excluding network configurations.

3.7 Save Configuration

To keep the existing configurations permanently, users need to save the configurations first before resetting the Managed Industrial Switch. Select **Save Configuration** from the **Main Menu** and then the following screen page appears.

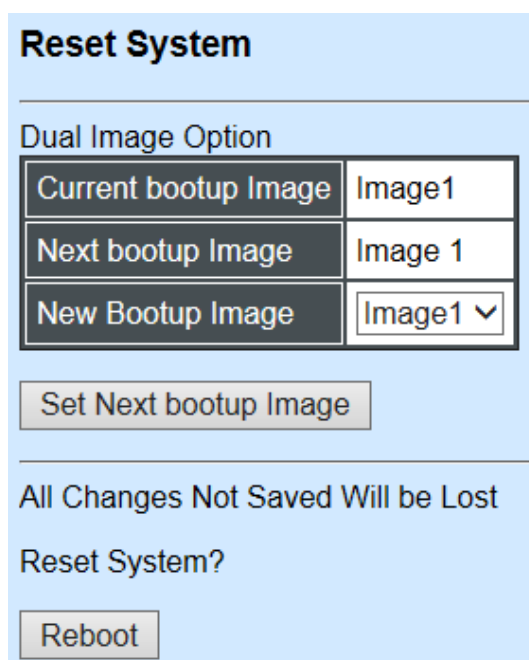

A light blue dialog box titled "Save Configuration". Below the title is a horizontal line. Underneath the line is the text "Save All Changes to Flash?". At the bottom left is a button labeled "OK".

Click the “**OK**” button to save changes or running configurations to Flash.

3.8 Reset System

After any configuration changes, **Reset System** can make changes effective. Select **Reset System** from the **Main menu** and then the following screen page appears.

A light blue screen titled "Reset System". Below the title is a horizontal line. Underneath the line is the text "Dual Image Option". Below this text is a table with three rows and two columns. The first row has "Current bootup Image" and "Image1". The second row has "Next bootup Image" and "Image 1". The third row has "New Bootup Image" and "Image1" with a dropdown arrow. Below the table is a button labeled "Set Next bootup Image". Below this button is a horizontal line. Underneath the line is the text "All Changes Not Saved Will be Lost". Below this text is the text "Reset System?". At the bottom is a button labeled "Reboot".

| | |
|----------------------|----------|
| Current bootup Image | Image1 |
| Next bootup Image | Image 1 |
| New Bootup Image | Image1 ▼ |

The Managed Industrial Switch supports Dual Image for boot-up, please select the next boot-up image before restarting.

Click the “**Set Next bootup Image**” button to set the designated image for booting up.

Click the “**Reboot**” button to restart the Managed Industrial Switch.

3.9 Logout

Select **Logout** from the **Main menu** and then the following screen page appears.

Click the “**OK**” button to logout the Managed Industrial Switch.

APPENDIX A: DHCP Auto-Provisioning Setup

Networking devices, such as switches or gateways, with DHCP Auto-provisioning function allow you to automatically upgrade firmware and configuration at startup process. Before setting up DHCP Server for auto-upgrade of firmware and configuration, please make sure the Managed Industrial Switch that you purchased supports DHCP Auto-provisioning. Setup procedures and auto-provisioning process are described below for your reference.

A. Setup Procedures

Follow the steps below to set up Auto Provisioning server, modify dhcpd.conf file and generate a copy of configuration file.

Step 1. Set Up Environment

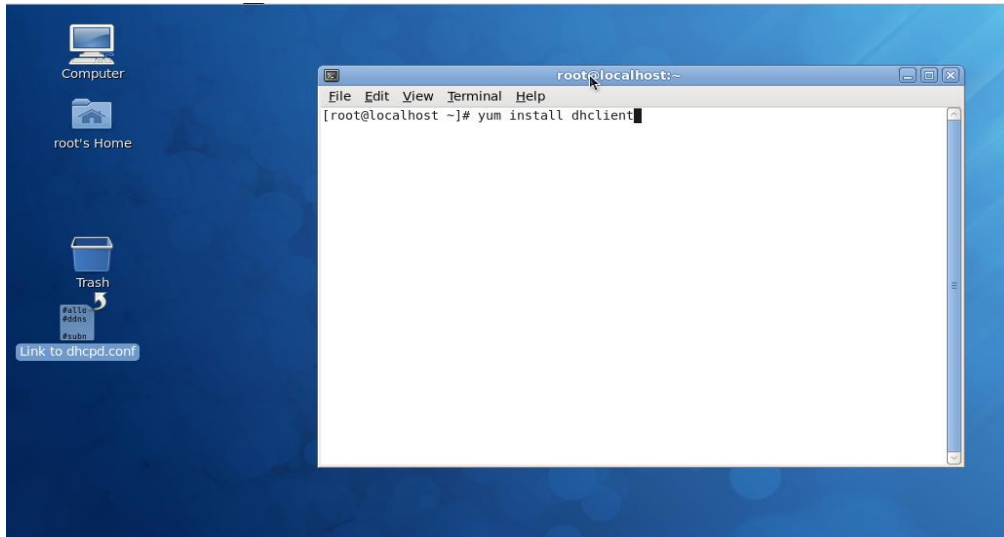

DHCP Auto-provisioning-enabled products that you purchased support the DHCP option 60 to work as a DHCP client. To make auto-provisioning function work properly, you need to prepare ISC DHCP server, File server (TFTP or FTP) and the switching device. See below for a possible network topology example.

Topology Example

Step 2. Set Up Auto Provision Server

- Update DHCP client

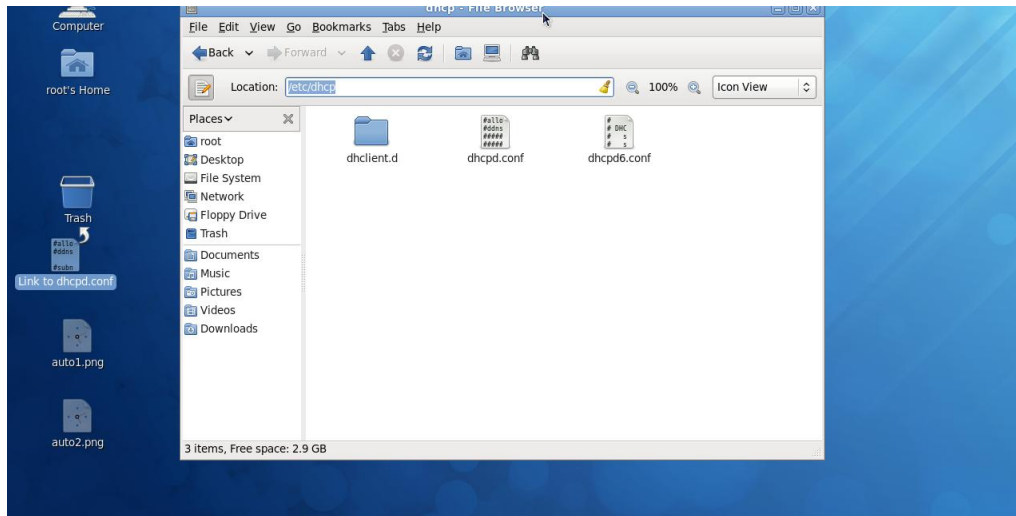

Linux Fedora 12 supports “yum” function by default. First of all, update DHCP client function by issuing “yum install dhclient” command.

- Install DHCP server

Issue “yum install dhcp” command to install DHCP server.

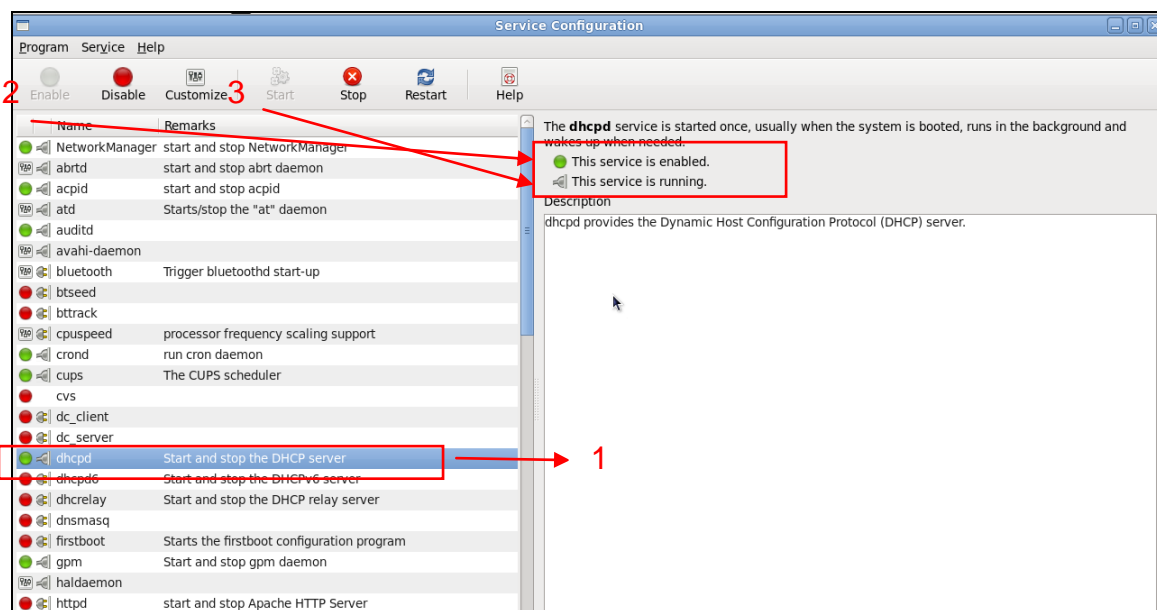

- **Copy dhcpd.conf to /etc/dhcp/ directory**

Copy dhcpd.conf file provided by the vendor to /etc/dhcp/ directory.

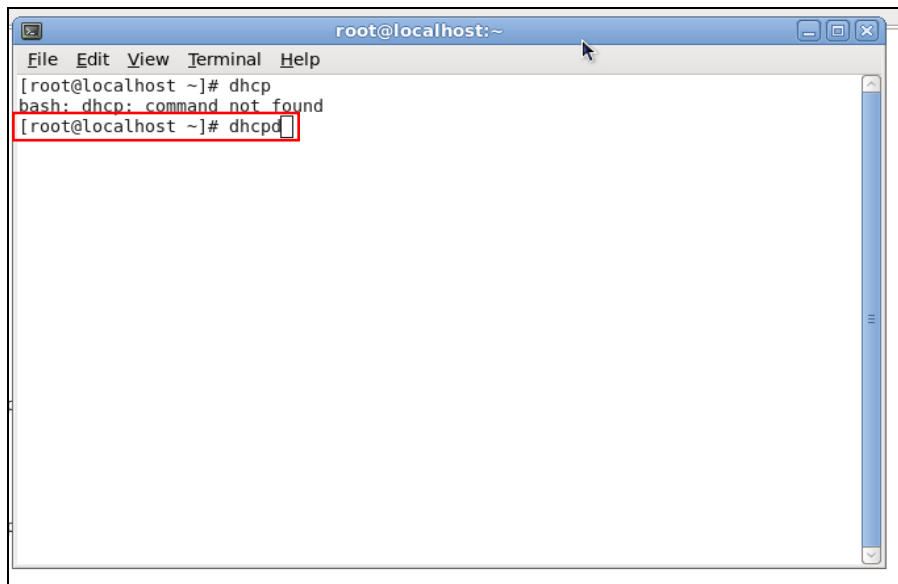

Please note that each vendor has its own way to define auto-provisioning. Make sure to use the file provided by the vendor.

- **Enable and run DHCP service**

1. Choose dhcpd.
2. Enable DHCP service.
3. Start running DHCP service.

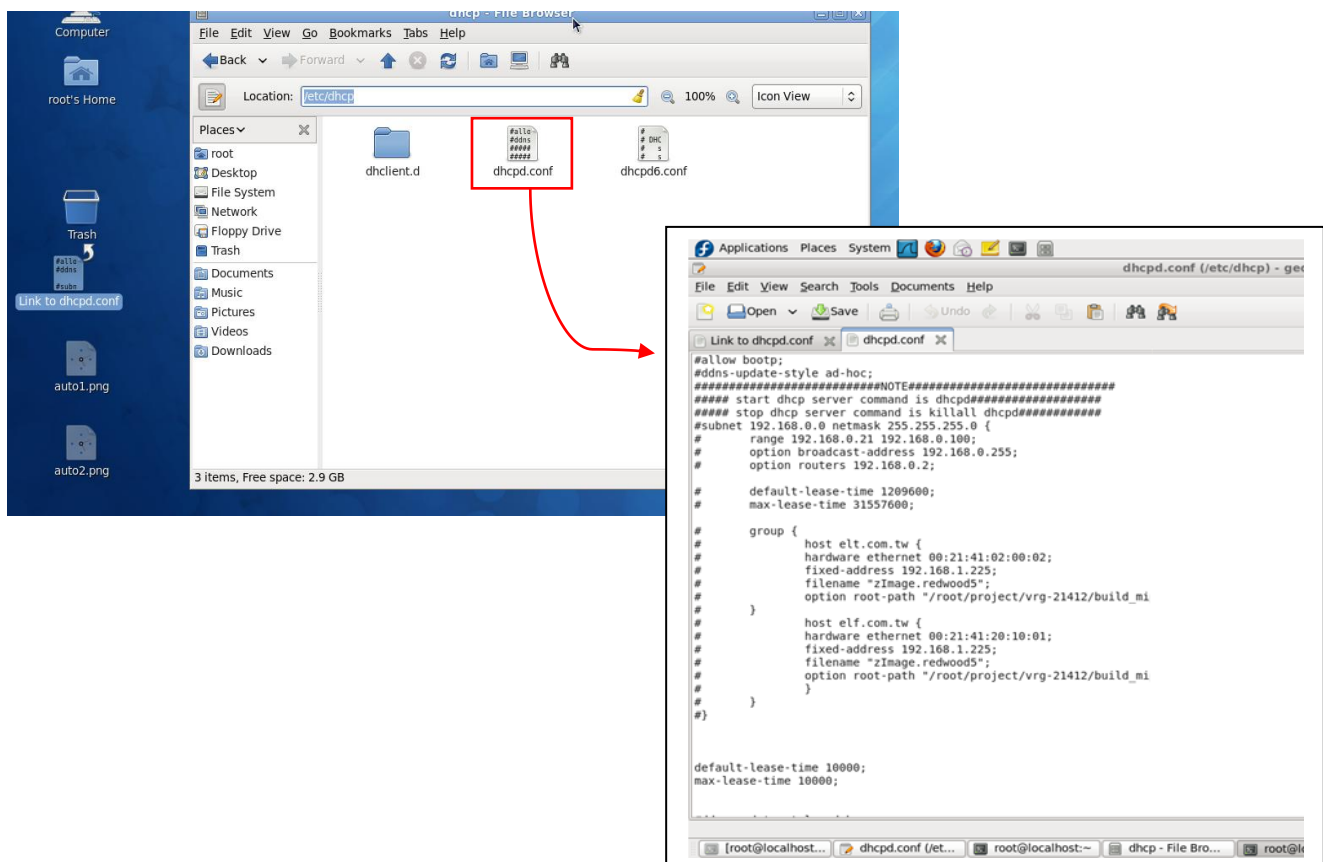

NOTE: DHCP service can also be enabled using CLI. Issue “dhcpd” command to enable DHCP service.

```
root@localhost:~  
File Edit View Terminal Help  
[root@localhost ~]# dhcp  
bash: dhcp: command not found  
[root@localhost ~]# dhcpd
```

Step 3. Modify dhcpd.conf File

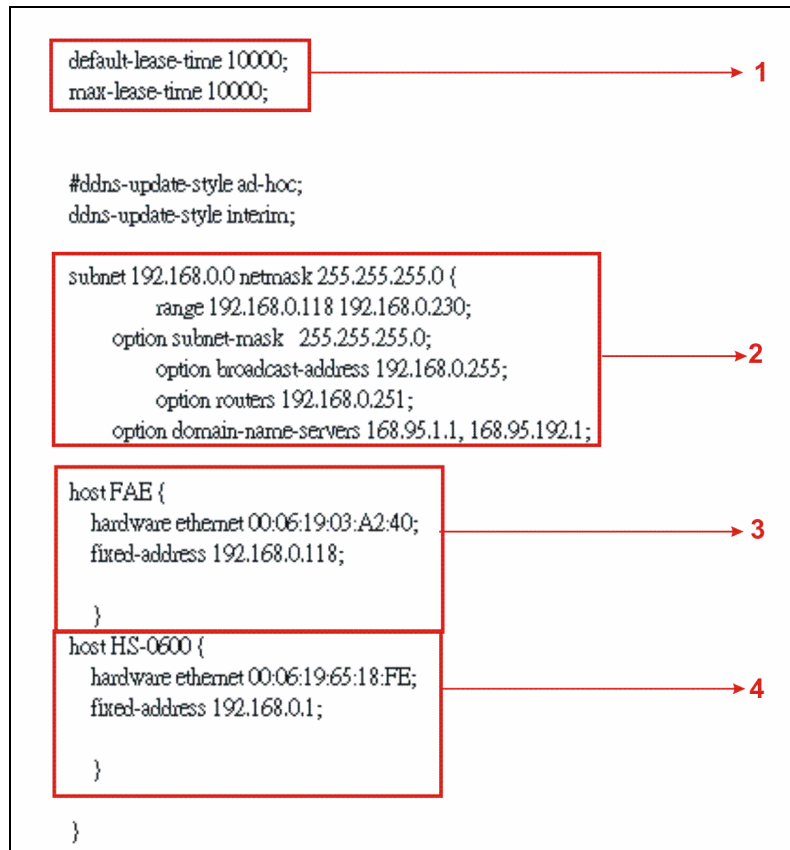

- Open dhcpd.conf file in /etc/dhcp/ directory

Double-click `dhcpd.conf` placed in `/etc/dhcp/` directory to open it.

● Modify dhcpd.conf file

The following marked areas in dhcpd.conf file can be modified with values that work with your networking environment.

1. Define DHCP default and maximum lease time in seconds.

Default lease time: If a client does not request a specific IP lease time, the server will assign a default lease time value.

Maximum lease time: This is the maximum length of time that the server will lease for.

2. Define subnet, subnet mask, IP range, broadcast address, router address and DNS server address.
3. Map a host's MAC address to a fixed IP address.
4. Map a host's MAC address to a fixed IP address. Use the same format to create multiple MAC-to-IP address bindings.

```

option space SWITCH;
# protocol 0: tftp, 1: ftp
option SWITCH.protocol code 1 = unsigned integer 8;
option SWITCH.server-ip code 2 = ip-address;
option SWITCH.server-login-name code 3 = text;
option SWITCH.server-login-password code 4 = text;
option SWITCH.firmware-file-name code 5 = text;
option SWITCH.firmware-md5 code 6 = string;
option SWITCH.configuration-file-name code 7 = text;
option SWITCH.configuration-md5 code 8 = string;
#16 bits option (bit 0: Urgency, bit 1-15: Reserve)
option SWITCH.option code 9 = unsigned integer 16;

class "vendor-classes" {
    match option vendor-class-identifier;
}

option SWITCH.protocol 1;
option SWITCH.server-ip 192.168.0.251;
# option SWITCH.server-login-name "anonymous";
option SWITCH.server-login-name "FAE";
option SWITCH.server-login-password "depl";

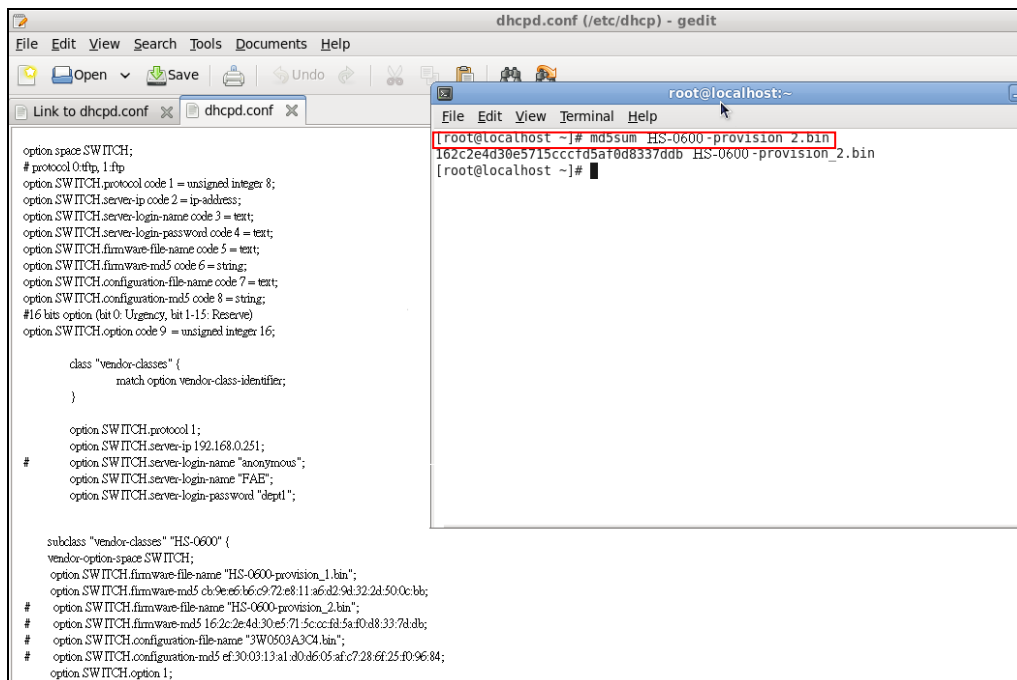

subclass "vendor-classes" "HS-0600" {
    vendor-option-space SWITCH;
    option SWITCH.firmware-file-name "HS-0600-provision_1.bin";
    option SWITCH.firmware-md5 cb:9e:e6:b6:c9:72:e8:11:a6:d2:9d:32:2d:50:0c:bb;
# option SWITCH.firmware-file-name "HS-0600-provision_2.bin";
# option SWITCH.firmware-md5 16:2c:2e:4d:30:e5:71:5c:cc:fd:5a:f0:d8:33:7d:db;
# option SWITCH.configuration-file-name "3W0503A3C4.bin";
# option SWITCH.configuration-md5 ef:30:03:13:a1:d0:d6:05:afc7:28:6f:25:f0:96:84;
option SWITCH.option 1;
}

```

5. This value is configurable and can be defined by users.
6. Specify the protocol used (Protocol 1: FTP; Protocol 0: TFTP).
7. Specify the FTP or TFTP IP address.
8. Login TFTP server anonymously (TFTP does not require a login name and password).
9. Specify FTP Server login name and password.
10. Specify the product model name.
11. Specify the firmware filename.
12. Specify the MD5 for firmware image.
13. Specify the configuration filename.
14. Specify the MD5 for configuration file.

NOTE 1: The text beginning with a pound sign (#) will be ignored by the DHCP server. For example, in the figure shown above, firmware-file-name "HS-0600-provision_2.bin" and firmware-md5 (line 5 & 6 from the bottom) will be ignored. If you want DHCP server to process these two lines, remove pound signs in the initial of each line.

NOTE 2: You can use either free software program or Linux default md5sum function to get MD5 checksum for firmware image and configuration file.

```
dhcpd.conf (/etc/dhcp) - gedit

root@localhost ~# killall dhcpcd
root@localhost ~#
```

Every time you modify dhcpd.conf file, DHCP service must be restarted. Issue “killall dhcpd” command to disable DHCP service and then issue “dhcpd” command to enable DHCP service.

Step 4. Backup a Configuration File

Before preparing a configuration file in TFTP/FTP Server, make sure the device generating the configuration file is set to “**Get IP address from DHCP**” assignment. DHCP Auto-provisioning is running under DHCP mode, so if the configuration file is uploaded by the network type other than DHCP mode, the downloaded configuration file has no chance to be equal to DHCP when provisioning, and it results in MD5 never matching and causes the device to reboot endlessly.

In order to have your Managed Industrial Switch retrieve the correct configuration image in TFTP/FTP Server, please make sure the filename of your configuration file is defined exactly the same as the one specified in **dhcpd.conf**. For example, if the configuration image’s filename specified in dhcpd.conf is “metafile”, the configuration image filename should be named to “metafile” as well.

Step 5. Place a Copy of Firmware and Configuration File in TFTP/FTP

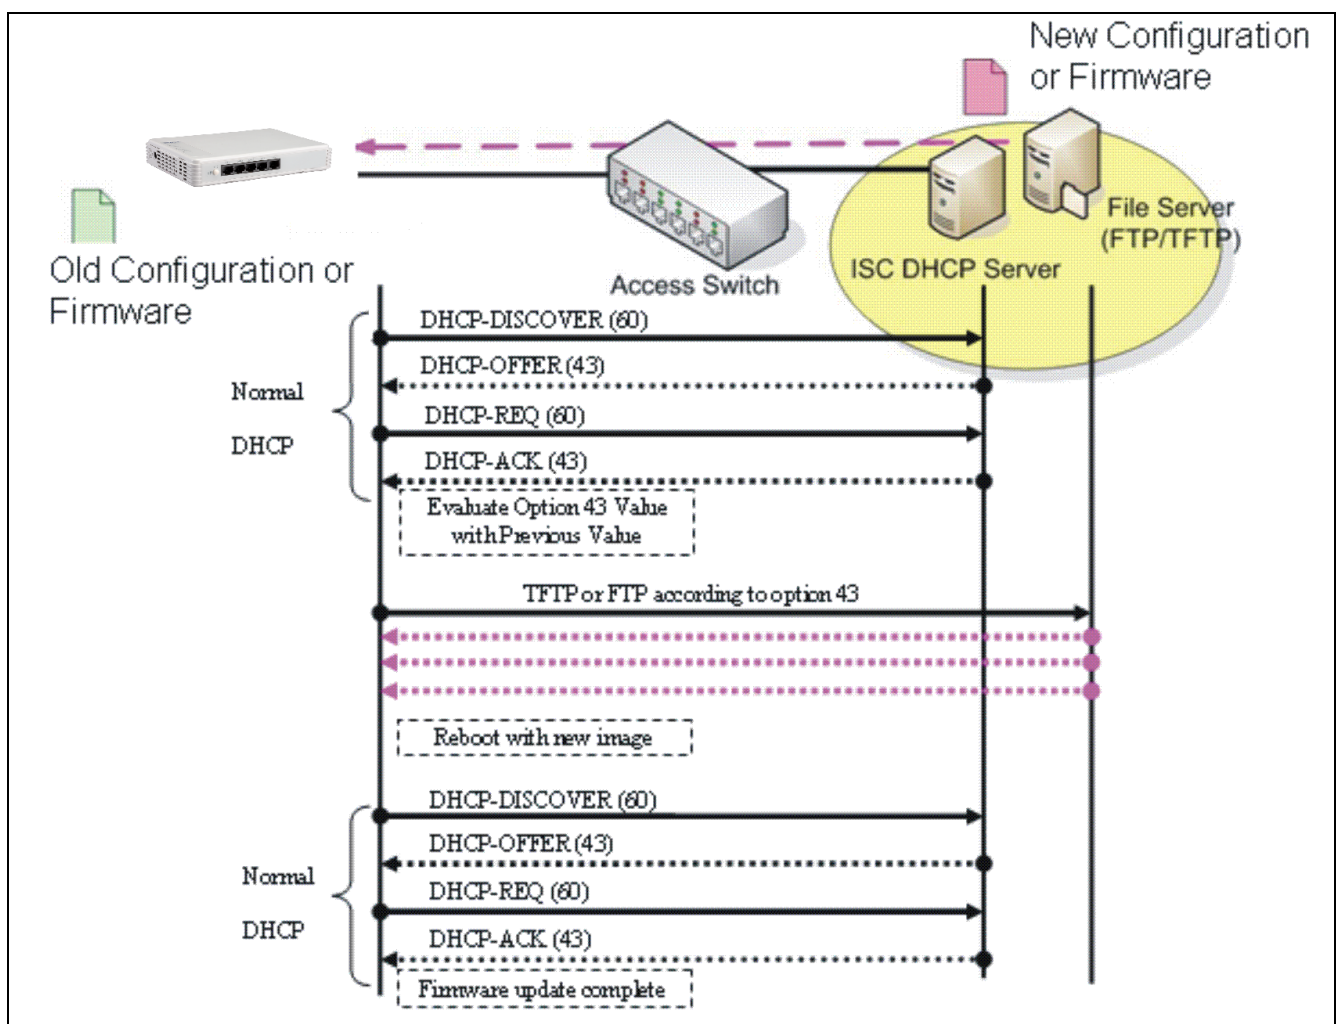

The TFTP/FTP File server should include the following items:

1. Firmware image (This file is provided by the vendor.)
2. Configuration file (This file is generally created by users.)
3. User account for your device (For FTP server only.)

B. Auto-Provisioning Process

This switching device is setting-free (through auto-upgrade and configuration) and its upgrade procedures are as follows:

1. ISC DHCP server will recognize the device when it receives an IP address request sent by the device, and it will tell the device how to get a new firmware or configuration.
2. The device will compare the firmware and configuration MD5 code form of DHCP option every time it communicates with DHCP server.
3. If MD5 code is different, the device will then upgrade the firmware or configuration. However, it will not be activated immediately.
4. If the Urgency Bit is set, the device will be reset to activate the new firmware or configuration immediately.
5. The device will retry for 3 times if the file is incorrect, and then it gives up until getting another DHCP ACK packet again.

APPENDIX B: Free RADIUS readme

The advanced RADIUS Server Set up for **RADIUS Authentication** is described as below.

When free RADIUS client is enabled on the device, the server side needs to put this file "**dictionary.sample**" under the directory **/raddb**, and modify these three files - "**users**", "**clients.conf**" and "**dictionary**", which are on the disc shipped with this product.

In the file "**users**":

Set up the user name, password, and other attributes.

In the file "**clients.conf**":

Set the valid range of RADIUS client IP address.

In the file "**dictionary**":

Add this following line -

```
$INCLUDE dictionary.sample
```

Note: Please use any text editing software (e.g. Notepad) to carry out the file editing works.
